Paper 1

Monday 20 May 2019

Afternoon

Time allowed: 2 hours

Materials

For this paper you must have:

- a pencil and a ruler
- a scientific calculator
- a Data and Formulae Booklet.

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do **all** rough work in this book. Cross through any work you do not want to be marked.
- Show **all** your working.

Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 85.
- You are expected to use a scientific calculator where appropriate.
- A Data and Formulae Booklet is provided as a loose insert.

Section A

Answer **all** questions in this section.

0 1 . 1

Two isotopes of iodine are $^{125}_{53}\text{I}$ and $^{131}_{53}\text{I}$.

Determine, for these two isotopes, the difference between the constituents of the nuclei.

[1 mark]

Iodine-131 has 6 more neutrons than iodine-125 (78 neutrons compared with 72); both have 53 protons.

0 1 . 2

A $^{131}_{53}\text{I}$ nuclide undergoes beta (β^-) decay to form a xenon nuclide.

State the nucleon number of the xenon nuclide.

[1 mark]

131

0 1 . 3

A $^{125}_{53}\text{I}$ nuclide decays by electron capture to form a tellurium nuclide.State **two** differences between the constituents of the iodine nucleus and the tellurium nucleus it decays into.

[2 marks]

The tellurium nucleus has 1 more neutron than the iodine-125 nucleus (73 instead of 72).

The tellurium nucleus has 1 fewer proton than the iodine-125 nucleus (52 instead of 53).

0 1 . 4

Internal conversion is a process in which a nucleus in an excited state can release its excess energy. In internal conversion all of the excess energy is transferred from the nucleus to an orbital electron through the electromagnetic force. This orbital electron is ejected from the atom.

The tellurium nucleus formed in question 01.3 is in an excited state and can undergo internal conversion.

Discuss **three** differences between internal conversion and beta (β^-) decay.

[3 marks]

1 *In internal conversion only an (orbital) electron is released, but in beta decay an electron and an anti-neutrino are released.*

2 *In internal conversion the electrons released all have the same discrete energy, but in beta decay the electrons have a range of energies.*

3 *Beta decay is mediated by the weak interaction (W^- boson), whereas internal conversion is mediated by the electromagnetic force (virtual photons).*

7

Turn over ►

0 2

Some cars are fitted with a water sensor designed to switch on windscreen wipers automatically when it rains. **Figure 1** shows a simplified diagram of the sensor.

Figure 1

A light ray travels from the light-emitting diode (LED) through the first prism and into the windscreen. The ray reflects off the surfaces of the windscreen at **A**, **B** and **C** and then passes through the second prism into the detector.

0 2 . 1

Suggest how the design ensures that there is no deviation of the ray as it enters the first prism.

[1 mark]

The ray enters the first prism along the normal to its surface (at right angles to the surface, angle of incidence 0°).

0 2 . 2

Suggest **two** features of the design that ensure that there is no deviation of the ray as it leaves the first prism and enters the windscreen glass.

[2 marks]

- 1 *The prism is made of a material with the same refractive index as the windscreen glass.*
- 2 *The prism is fitted to the windscreen with no gaps between them (in full contact).*

0 2 . 3

The refractive index of the windscreen glass is 1.52

Explain why the ray follows the path shown inside the windscreen glass in **Figure 1**.
Support your answer with a suitable calculation.

[2 marks]

$$\sin C = 1 / n = 1 / 1.52 = 0.658$$

$$\text{critical angle } C = 41.1^\circ$$

The angle of incidence at A, B and C is 45° , which is greater than the critical angle of 41.1° , so total internal reflection takes place at each boundary.

Question 2 continues on the next page

Turn over ►

0 2 . 4

When it starts to rain, water droplets form on the outside of the windscreen as shown in **Figure 2**.

Figure 2

The refractive index of water is 1.33

Explain why the presence of water at **A** causes the intensity of the light at the detector to decrease.

Support your answer with a suitable calculation.

[2 marks]

glass to water: $\sin C = n_{\text{water}} / n_{\text{glass}} = 1.33 / 1.52 = 0.875$

critical angle at glass-water boundary $C = 61.0^\circ$

$(1.52 \sin 45^\circ = 1.33 \sin r \text{ gives } r = 53.9^\circ \text{ in the water})$

At A the angle of incidence (45°) is now less than the critical angle for the glass-water boundary (61.0°), so total internal reflection no longer takes place at A.

Some of the light refracts (escapes) into the water droplet and less light is reflected, so less light stays in the windscreen and the intensity at the detector decreases.

0 2 . 5

The refractive index of the windscreen glass can vary by a few per cent across the thickness of the glass.

Discuss how this variation may affect the path of the ray through the windscreen glass.

[2 marks]

As the refractive index changes across the thickness, the light may change direction (bend gradually) inside the windscreen, and may change direction slightly at the windscreen boundaries, because the angles of incidence change.

However, a variation of only a few per cent is too small to deviate the ray significantly, and the critical angle changes by only about 1° , so the angle of 45° is still well above it and total internal reflection at A, B and C is unaffected.

0 2 . 6

A different design has the LED and the detector further apart. The ray undergoes more reflections inside the windscreen glass before reaching the detector.

Discuss **two** ways in which this different design affects the sensitivity of the sensor to the presence of water droplets.

[2 marks]

1 *More sensitive: the ray reflects off the outer surface at more points, covering a larger area, so it is more likely to encounter water drops, giving a bigger decrease in light intensity.*

2 *Less sensitive: the longer path means greater absorption in the glass, and the ray is more likely to meet imperfections or dirt on the glass, so the intensity is reduced even without water.*

0 3

Figure 3 shows an arrangement to investigate diffraction. White light is incident on a single slit. After leaving the slit, the diffracted light passes through a green filter to reach the screen.

Figure 3

Not to scale

0 3 . 1

Describe the pattern produced on the screen.

[2 marks]

*A bright green central maximum with dimmer, lower intensity maxima on either side, separated by dark fringes (minima).
The central maximum is twice as wide as the other maxima.*

0 3 . 2

The green filter is replaced with a red filter.

Describe the change in the pattern produced on the screen.

[2 marks]

*The (central) maximum becomes wider, because red light has a longer wavelength.
The subsequent maxima are further apart (more spread out).*

0 3 . 3

A diffraction grating is placed between the red filter and the screen. The diffraction grating has 500 lines per millimetre. Light is incident normally on the grating. **Figure 4** shows the arrangement.

Figure 4**Not to scale**

The wavelength of the red light is 650 nm.

Calculate the angle θ between a first-order maximum and the central maximum.

[2 marks]

$$d = 1 \times 10^{-3} / 500 = 2.0 \times 10^{-6} \text{ m}$$

$$d \sin \theta = n\lambda \text{ with } n = 1$$

$$\sin \theta = 650 \times 10^{-9} / 2.0 \times 10^{-6} = 0.325$$

$$\theta = 19.0^\circ$$

$\theta =$ 19 degrees

Question 3 continues on the next page

Turn over ►

0 3 . 4

In practice, the filter transmits red light with wavelengths in the range 600 nm to 700 nm.

Suggest how this affects the appearance of the maxima.

[2 marks]

$\sin \theta = n\lambda / d$ for $\lambda = 600 \text{ nm}$ and $\lambda = 700 \text{ nm}$:

$n = 1$: $\theta = 17.5^\circ$ to 20.5° (range 3°)

$n = 2$: $\theta = 36.9^\circ$ to 44.4° (range 7.5°)

$n = 3$: $\theta = 64.2^\circ$ to 90° , since $\sin \theta > 1$ for $\lambda > 667 \text{ nm}$

$n = 0$: $\theta = 0$ for all wavelengths

The central maximum is unchanged in width. Each other maximum is broader, as each order covers a range of angles.

The maxima get gradually broader (more spread out) at greater orders, and part of the third order maximum is missing for the longest wavelengths (θ would be over 90°).

0 4

Figure 5 shows a simplified catapult used to hurl projectiles a long way.

Figure 5

The counterweight is a wooden box full of stones attached to one end of the beam. The projectile, usually a large rock, is in a sling hanging vertically from the other end of the beam. The weight of the sling is negligible. The beam is held horizontal by a rope attached to the frame.

0 4 . 1

The catapult is designed so that the weight of the beam and the weight of the **empty** wooden box have no effect on the tension in the rope.

Suggest how the pivot position achieves this.

[2 marks]

The pivot is positioned at the centre of mass of the beam and empty box combined.

So the anticlockwise moment of the weight of the beam about the pivot equals the clockwise moment of the weight of the empty box: their moments balance (sum of moments is zero), so they need no force from the rope and do not affect the tension.

Question 4 continues on the next page

Turn over ►

0 4 . 2

The stones in the counterweight have a total mass of 610 kg and the projectile weighs 250 N.

Calculate the tension in the rope.

[5 marks]

Taking moments about the pivot:

$$\text{clockwise moment} = 610 \times 9.81 \times 1.5 = 8976 \text{ N m}$$

$$\text{anticlockwise moment} = 250 \times 4.0 + T \sin 50^\circ \times 4.0$$

(vertical component of tension = $T \sin 50^\circ$)

clockwise moment = anticlockwise moment:

$$8976 = 1000 + 4.0 T \sin 50^\circ$$

$$T \sin 50^\circ = 7976 / 4.0 = 1994 \text{ N}$$

$$T = 1994 / \sin 50^\circ = 2600 \text{ N}$$

tension = 2600 N

0 4 . 3

When the rope is cut, the counterweight rotates clockwise. When the beam is vertical it is prevented from rotating further. The projectile is then released horizontally with a velocity of 18 m s^{-1} , as shown in **Figure 6**.

The projectile is released at a height of 7.5 m above ground level.

Figure 6

The range of the catapult is the horizontal distance between the point where the projectile is released to the point where it lands.

Calculate the range.
Ignore air resistance.

[2 marks]

$$\text{vertically: } s = ut + \frac{1}{2}at^2 \text{ with } u = 0$$

$$7.5 = \frac{1}{2} \times 9.81 \times t^2 \quad \text{so} \quad t = 1.24 \text{ s}$$

$$\text{horizontally: } s = ut = 18 \times 1.24$$

$$\text{range} = 22 \text{ m}$$

$$\text{range} = \underline{\quad 22 \quad} \text{ m}$$

0	4	.	4
---	---	---	---

In another release, the sling is adjusted so that a projectile of the same mass is released just before the wooden beam is vertical. The projectile is not released horizontally.

Discuss the effect this change has on the range of the catapult.

[3 marks]

The range will be smaller.

When the projectile is released before the beam is vertical, the counterweight has fallen a smaller distance before release, so less energy is transferred to the rock.

So the initial speed of the rock is less, and because the velocity is not horizontal, its horizontal component of velocity is reduced further.

Therefore the range is smaller.

12

Turn over ►

0 5

Safety barriers are used on UK motorways to prevent vehicles crossing from one carriageway to the other carriageway. The barriers also absorb some of the kinetic energy of a vehicle and deflect vehicles along the barrier.

The standard test of a safety barrier uses a vehicle that contains dummies. The total mass of the vehicle and its contents is $1.5 \times 10^3 \text{ kg}$ and its initial speed is 110 km h^{-1} .

0 5 1

Show that the initial kinetic energy of the test vehicle is 700 kJ.

[2 marks]

$$v = 110 \times 1000 / 3600 = 30.6 \text{ m s}^{-1}$$

$$E_k = \frac{1}{2}mv^2 = \frac{1}{2} \times 1.5 \times 10^3 \times 30.6^2$$

$$E_k = 7.0 \times 10^5 \text{ J} \approx 700 \text{ kJ}$$

0 5 2

The test vehicle hits a steel safety barrier at an angle of 20° , as shown in **Figure 7**.

Figure 7

Calculate the component of the momentum of the test vehicle in a direction along the line of the safety barrier.
Give an appropriate unit for your answer.

[3 marks]

$$\text{momentum} = \text{mass} \times \text{velocity component along barrier}$$

$$\text{component of velocity} = 30.6 \times \cos 20^\circ = 28.7 \text{ m s}^{-1}$$

$$p = 1.5 \times 10^3 \times 30.6 \times \cos 20^\circ$$

$$p = 4.3 \times 10^4 \text{ kg m s}^{-1}$$

momentum = 4.3×10^4 unit kg m s^{-1}

0 5 . 3

Immediately after the collision, the test vehicle moves along the safety barrier with no change in its momentum in this direction.

Show that the kinetic energy lost in the collision is about 80 kJ.

[3 marks]

$$KE \text{ before collision} = 700 \text{ kJ}$$

$$\text{speed parallel to barrier after} = 30.6 \times \cos 20^\circ = 28.7 \text{ m s}^{-1}$$

$$KE \text{ after} = \frac{1}{2} \times 1.5 \times 10^3 \times 28.7^2 = 618 \text{ kJ}$$

$$\text{change in KE} = 700 - 618 = 82 \text{ kJ} \approx 80 \text{ kJ}$$

(check: $v^2 = v_{\parallel}^2 + v_{\perp}^2$, so total KE = KE due to speed parallel
+ KE due to speed perpendicular to barrier; $v_{\perp} = 30.6 \sin 20^\circ = 10.5 \text{ m s}^{-1}$
and KE lost = $\frac{1}{2} \times 1.5 \times 10^3 \times 10.5^2 = 82 \text{ kJ}$)

0 5 . 4

The steel safety barrier deforms during the collision. For the barrier to pass the test, the test vehicle should not move more than 1.5 m towards the other carriageway.

The barrier can apply an average force of 60 kN at right angles to the carriageway.

Deduce whether the safety barrier will pass the test.

[3 marks]

$$\text{work done} = \text{force} \times \text{distance}$$

average force needed to stop the vehicle within 1.5 m:

$$F = 82\,000 / 1.5 = 5.5 \times 10^4 \text{ N}$$

$5.5 \times 10^4 \text{ N}$ (55 kN) is less than 60 kN

(or: work done by barrier over 1.5 m = $60 \text{ kN} \times 1.5 \text{ m} = 90 \text{ kJ}$,
which is greater than the 82 kJ to be removed)

The barrier only needs 55 kN, less than the 60 kN it can apply, so yes,
it passes the test.

Question 5 continues on the next page

Turn over ►

0 5 . 5

A different safety barrier uses a solid concrete wall which does not deform. The same standard test is carried out on a concrete wall.

Discuss which type of barrier would cause less damage to the dummies in the test.

[2 marks]

The steel barrier causes less damage. It deforms, which increases the time of contact (and the stopping distance) during the collision.

Impulse = $F\Delta t$ = change in momentum, and the change in momentum is the same, so a longer time means a smaller force on the dummies (similarly work done = Fs , so a larger distance means a smaller force).

13

0 6

A loudspeaker cone is driven by a signal generator (oscillator).

Figure 8 shows the variation of displacement with time t for a point **P** at the centre of the cone. **P** is oscillating with simple harmonic motion.

Figure 8

0 6 . 1

State the time, in milliseconds, when **P** is moving at its maximum positive velocity.

[1 mark]

time = 1.5 ms

0 6 . 2

Calculate the maximum acceleration of **P**.

[3 marks]

$$A = 4.2 \text{ mm}, \quad T = 2.0 \text{ ms} \quad \text{so} \quad f = 1/T = 500 \text{ Hz}$$

$$a_{\max} = \omega^2 A = (2\pi f)^2 A$$

$$a_{\max} = (2\pi \times 500)^2 \times 4.2 \times 10^{-3}$$

$$a_{\max} = 4.1 \times 10^4 \text{ m s}^{-2}$$

acceleration = 4.1×10^4 m s^{-2}

Question 6 continues on the next page

Turn over ►

0	6	.	3
---	---	---	---

The loudspeaker creates variations in pressure and produces a sound wave in the air around it.

State the type of wave produced and describe the motion of the particles in this type of wave.

[1 mark]

*Longitudinal wave: the air particles oscillate (vibrate) parallel to the
direction of energy transfer of the wave.*

5

0 7

Figure 9 shows a practical circuit in which a variable resistor is used to control the brightness of a lamp. The voltmeter reading is monitored as the variable resistor is adjusted to make the lamp brighter.

Figure 9

0 7 . 1

Explain why the reading on the voltmeter decreases as the brightness of the lamp increases.

[2 marks]

As the resistance of the variable resistor decreases, the total resistance decreases and the current increases, making the lamp brighter.

So the lost volts (pd across the internal resistance of the cell, Ir) increase, and the terminal pd shown by the voltmeter ($V = \varepsilon - Ir$) decreases.

0 7 . 2

The variable resistor is adjusted so that the lamp is at its brightest. The reading V_1 on the voltmeter is noted. A second identical cell is then connected in parallel with the cell in **Figure 9**. The new reading V_2 on the voltmeter is noted.

Explain why V_2 is greater than V_1 .

[2 marks]

Two identical cells in parallel behave as a single cell with the same emf but half the internal resistance.

So the internal resistance is a smaller proportion of the total resistance and the lost volts are reduced (the current through each cell is less), so the terminal pd V_2 is greater than V_1 .

Section B

Each of Questions 8 to 32 is followed by four responses, A, B, C and D.

For each question select the best response.

Only **one** answer per question is **allowed**.

For each question **completely fill** in the circle alongside the appropriate answer.

CORRECT METHOD

WRONG METHODS

If you want to change your answer you must cross out your original answer as shown.

If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown.

You may do your working in the blank space around each question but this will not be marked.

Do **not** use additional sheets for this working.

The graph shows the variation of displacement d with time t for a particle moving with simple harmonic motion of period T .

Which graph shows the variation of kinetic energy E_k of the particle with time?

[1 mark]

A ☐

B ☐

C ☐

D ☒

3 0

Two pendulums **A** and **B** oscillate with simple harmonic motion.
The time period of **A** is 2.00 s and the time period of **B** is 1.98 s.

A and **B** are released in phase.

What is the number of oscillations of **A** before **A** and **B** are next in phase?

[1 mark]**A** 49☐**B** 50☐**C** 99☒**D** 100☐**3 1**

The frequency of oscillation of a vertical spring is f when the mass hanging from the spring is m .

What is the relationship between f and m ?

[1 mark]**A** $f \propto m^{-\frac{1}{2}}$ ☒**B** $f \propto m^{-2}$ ☐**C** $f \propto m^{\frac{1}{2}}$ ☐**D** $f \propto m^2$ ☐

A metal panel is driven to vibrate at different frequencies. The amplitude a of the vibration is measured at each frequency. The graph shows the variation of amplitude with driven frequency.

The damping of the metal panel is increased without changing the mass of the panel.

Which graph on the opposite page shows the variation of a with frequency with increased damping?

[1 mark]

- A** ☐
- B** ☐
- C** ☐
- D** ☒
