Paper 2

Friday 24 May 2019

Morning

Time allowed: 2 hours

Materials

For this paper you must have:

- a pencil and a ruler
- a scientific calculator
- a Data and Formulae Booklet.

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do **all** rough work in this book. Cross through any work you do not want to be marked.
- Show **all** your working.

Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 85.
- You are expected to use a scientific calculator where appropriate.
- A Data and Formulae Booklet is provided as a loose insert.

Section AAnswer **all** questions in this section.

0	1
---	---

Figure 1 shows a perfectly insulated cylinder containing 0.050 kg of liquid nitrogen at a temperature of 70 K.

A heater transfers energy at a constant rate of 12 W to the nitrogen.

A piston maintains the pressure at 1.0×10^5 Pa during the heating process.

Figure 1**not to scale**

0 1 . 1

The nitrogen is heated from 70 K and is completely turned into a gas after 890 s.

Calculate the specific heat capacity of liquid nitrogen.
Give an appropriate unit for your answer.

specific latent heat of vaporisation of nitrogen = $2.0 \times 10^5 \text{ J kg}^{-1}$

boiling point of nitrogen = 77 K

[5 marks]

Total energy supplied: $E = Pt = 12 \times 890 = 10\,680 \text{ J}$

Energy to vaporise the nitrogen at its boiling point:

$Q = ml = 0.050 \times 2.0 \times 10^5 = 10\,000 \text{ J}$

Energy used to heat the liquid from 70 K to 77 K:

$10\,680 - 10\,000 = 680 \text{ J}$

$Q = mc\Delta\theta$ so $c = Q / (m\Delta\theta)$

$c = (10\,680 - 10\,000) / (0.050 \times (77 - 70))$

$c = 680 / 0.35 = 1940 \text{ J kg}^{-1} \text{ K}^{-1}$

$c \approx 1.9 \times 10^3 \text{ J kg}^{-1} \text{ K}^{-1}$

specific heat capacity = 1.9×10^3 unit = $\text{J kg}^{-1} \text{ K}^{-1}$

Question 1 continues on the next page

Turn over ►

0 1 . 2

The work done by the nitrogen in the cylinder when expanding due to a change of state is **X**.

The energy required to change the state of the nitrogen from a liquid to a gas is **Y**.

Deduce which is greater, **X** or **Y**.

density of liquid nitrogen at its boiling temperature = 810 kg m^{-3}

density of nitrogen gas at its boiling temperature = 3.8 kg m^{-3}

[4 marks]

$$\text{Volume} = m / \rho$$

$$\text{Volume of nitrogen gas} = 0.050 / 3.8 = 0.013 \text{ m}^3$$

$$\text{Volume of liquid nitrogen} = 0.050 / 810 = 6.2 \times 10^{-5} \text{ m}^3$$

(the volume of the liquid is negligible compared with the gas)

$$\Delta V = 0.013 - 0.000062 \approx 0.013 \text{ m}^3$$

$$\text{Work done in expanding, } X = p\Delta V$$

$$X = 1.0 \times 10^5 \times 0.013 = 1.3 \times 10^3 \text{ J}$$

$$\text{Energy to change state, } Y = ml = 0.050 \times 2.0 \times 10^5$$

$$Y = 1.0 \times 10^4 \text{ J}$$

$X = 1.3 \times 10^3 \text{ J}$ is less than $Y = 1.0 \times 10^4 \text{ J}$, so $X < Y$: Y is greater.

0 2 . 1

State what is meant by the internal energy of a gas.

[2 marks]

It is the sum (total) of the randomly distributed kinetic and potential energies of all the particles (molecules) in the gas.

0 2 . 2

Absolute zero of temperature can be interpreted in terms of the ideal gas laws or the kinetic energy of particles in an ideal gas.

Describe these two interpretations of absolute zero of temperature.

[2 marks]

Gas laws: absolute zero is the temperature at which the pressure (or volume) of a gas extrapolates to zero, i.e. when $pV = nRT$ is zero.

Kinetic energy: absolute zero is the temperature at which the random motion of the particles stops, so the kinetic energy of the particles is zero.

Question 2 continues on the next page

Turn over ►

0 2 . 3

A mixture of argon atoms and helium atoms is in a cylinder enclosed with a piston. The mixture is at a temperature of 310 K.

Calculate the root mean square speed (c_{rms}) of the argon atoms in the mixture.

$$\text{molar mass of argon} = 4.0 \times 10^{-2} \text{ kg mol}^{-1}$$

[3 marks]

$$\text{Mass of argon atom } m = \text{molar mass} / N_A$$

$$m = 4.0 \times 10^{-2} / 6.02 \times 10^{23} = 6.64 \times 10^{-26} \text{ kg}$$

$$\frac{1}{2} m(c_{rms})^2 = 3kT/2 \text{ so } c_{rms} = \sqrt{3kT / m}$$

$$c_{rms} = \sqrt{(3 \times 1.38 \times 10^{-23} \times 310 / 6.64 \times 10^{-26})}$$

$$c_{rms} = \sqrt{(1.93 \times 10^5)} = 440 \text{ m s}^{-1}$$

$$c_{rms} = \underline{\quad 440 \quad} \text{ m s}^{-1}$$

0 2 . 4

Compare the mean kinetic energy of the argon atoms and the helium atoms in the mixture.

[1 mark]

They are the same: at the same temperature both gases have the same mean (average) kinetic energy per atom ($3kT/2$).

0 2 . 5

Explain, in terms of the kinetic theory model, why a pressure is exerted by the gas on the piston.

[3 marks]

The atoms move randomly and collide with the piston (walls) and rebound, so their momentum changes at each collision.

By Newton's second law the piston exerts a force on each atom equal to the rate of change of momentum, so the atoms exert an equal and opposite force on the piston (Newton's third law).

Many atoms collide per second, giving a steady total force on the piston,
and pressure = force / area ($p = F/A$) of the piston.

0 2 . 6

The mixture of gases in the cylinder stays the same.

Explain, using the kinetic theory model, **two** changes that can be made independently to reduce the pressure exerted by the gas.

[3 marks]

Change 1: increase the volume (move the piston out). The atoms travel further between collisions, so there is more time between collisions with the piston/walls (less frequent collisions), so the rate of change of momentum, the force, and so the pressure fall.

Change 2: reduce the temperature. The atoms move more slowly, so each collision causes a smaller change in momentum at the wall, and there are also fewer collisions per second, so the rate of change of momentum and the pressure fall.

14

Turn over ►

0 3 . 1 Define gravitational potential at a point.

[1 mark]

The work done (energy required) per unit mass in bringing a small mass from infinity to that point.

0 3 . 2 Figure 2 shows the positions of equipotential surfaces at different distances from the centre of the Moon.

Figure 2

Explain how the equipotential surfaces in **Figure 2** show that the gravitational field is **not** uniform.

[1 mark]

The potential difference between neighbouring surfaces is constant (0.30×10^6 J kg $^{-1}$) but the distances between them are not equal (0.35 and 0.48×10^6 m), so $\Delta V/\Delta r$ (the field strength) is changing. The surfaces are also curved, not straight and parallel.

0 3 . 3 Calculate, using **Figure 2**, the escape velocity at the surface of the Moon.

radius of Moon = 1.74×10^6 m

[4 marks]

$$V = -GM / r \text{ so } M = -Vr / G$$

$$M = -(-1.60 \times 10^6) \times 3.06 \times 10^6 / 6.67 \times 10^{-11}$$

$$M = 7.3 \times 10^{22} \text{ kg}$$

$$\text{For escape: } GMm / r = \frac{1}{2} mv^2 \text{ so } v = \sqrt{(2GM / r)}$$

$$v = \sqrt{(2 \times 6.67 \times 10^{-11} \times 7.34 \times 10^{22} / 1.74 \times 10^6)}$$

$$v = \sqrt{(5.63 \times 10^6)} = 2370 \text{ m s}^{-1}$$

$$\text{escape velocity} \approx 2.4 \times 10^3 \text{ m s}^{-1}$$

escape velocity = 2.4×10^3 m s⁻¹

6

Turn over ►

0 4

Figure 3 shows an arrangement used to investigate the repulsive forces between two identical charged conducting spheres. The spheres are suspended by non-conducting thread.

Figure 3

Each sphere has a mass of 3.2×10^{-3} kg and a radius of 20 mm. The distance d is 40 mm.

The capacitance of a sphere of radius r is $4\pi\epsilon_0 r$.

Each sphere is charged by connecting it briefly to the positive terminal of a high-voltage supply, the other terminal of which is at 0 V. After this has been done the charge on each sphere is 52 nC.

0 4 . 1 Calculate the potential of one of the spheres.

[3 marks]

$$C = 4\pi\epsilon_0 r = 4\pi \times 8.85 \times 10^{-12} \times 0.020$$

$$C = 2.22 \times 10^{-12} \text{ F}$$

$$V = Q / C = 52 \times 10^{-9} / 2.22 \times 10^{-12}$$

$$V = 23\,400 \text{ V} \approx 2.3 \times 10^4 \text{ V}$$

potential = 2.3 × 10⁴ V

0 4 . 2 The charged spheres in **Figure 3** are at equilibrium.

Draw labelled arrows on **Figure 3** to show the forces on sphere **B**.

[2 marks]

0 4 . 3 Suggest a solution to **one** problem involved in the measurement of d in **Figure 3**.

[2 marks]

Problem: a metal ruler held between the spheres would conduct and disturb the charges/field, and touching the spheres would change their separation.

Solution: measure d from a distance with a travelling microscope (telescope) on a vernier scale, or use non-conducting (plastic) callipers with a ruler, aligned with the line joining the centres.

Question 4 continues on the next page

Turn over ►

0 4 . 4

Show that the magnitude of the electrostatic force on each sphere is about $4 \times 10^{-3} \text{ N}$.
[3 marks]

The charge acts as if at the centre of each sphere, so the

separation of the charges $r = 40 + 20 + 20 = 80 \text{ mm} = 0.080 \text{ m}$

$$F = Q_1 Q_2 / 4\pi\epsilon_0 r^2$$

$$F = (52 \times 10^{-9})^2 / (4\pi \times 8.85 \times 10^{-12} \times 0.080^2)$$

$$F = 3.8 \times 10^{-3} \text{ N} \approx 4 \times 10^{-3} \text{ N}$$

0 4 . 5

A student measures the angle θ when the apparatus in **Figure 3** is at equilibrium. The student records θ as 7° .

Discuss whether this measurement is consistent with the other data in this investigation.

[2 marks]

In equilibrium: $\tan \theta = F / mg$

$$\theta = \tan^{-1}(3.8 \times 10^{-3} / (3.2 \times 10^{-3} \times 9.81)) = 6.9^\circ$$

The calculated angle is 6.9° , which is very close to 7° , so the measurement is consistent with the other data.

0 4 . 6

The student says that the gravitational force between the two spheres has no **significant** effect on the angle at which the spheres are in equilibrium.

Deduce with a calculation whether this statement is valid.

[2 marks]

$$F_{\text{grav}} = GMm / r^2$$

$$F_{\text{grav}} = 6.67 \times 10^{-11} \times (3.2 \times 10^{-3})^2 / 0.080^2$$

$$F_{\text{grav}} = 1.1 \times 10^{-13} \text{ N}$$

$$F_{\text{elec}} \approx 4 \times 10^{-3} \text{ N}$$

$$F_{\text{elec}} / F_{\text{grav}} \approx 3.6 \times 10^{10}$$

$F_{\text{grav}} = 1.1 \times 10^{-13} \text{ N}$ is negligible compared with F_{elec} , so the statement is valid.

A square coil of wire is rotating at a constant angular speed about a horizontal axis. **Figure 4** shows the coil at one instant when the normal to the plane of the coil is at 30° to a magnetic field.

Figure 4

The area of the coil is $5.0 \times 10^{-4} \text{ m}^2$ and the flux density of the uniform magnetic field is $2.5 \times 10^{-2} \text{ T}$.

0 5 . 1 The maximum flux linkage of the coil during its rotation is 1.5×10^{-3} Wb turns.

Calculate the number of turns in the coil.

[2 marks]

Maximum flux linkage $N\Phi = BAN$ (coil normal parallel to B)

$$N = N\Phi / BA$$

$$N = 1.5 \times 10^{-3} / (2.5 \times 10^{-2} \times 5.0 \times 10^{-4})$$

$$N = 120 \text{ turns}$$

number of turns = 120

0 5 . 2 Calculate the flux linkage of the coil at the instant shown in **Figure 4**.

[1 mark]

$$N\Phi = BAN \cos \theta = 1.5 \times 10^{-3} \times \cos 30^\circ$$

$$N\Phi = 1.3 \times 10^{-3} \text{ Wb turns}$$

flux linkage = 1.3×10^{-3} Wb turns

Question 5 continues on the next page

Turn over ►

0 5 . 3

The coil forms part of an electrical generator. **Figure 5** shows the emf generated by the coil.

Figure 5

Calculate the peak value of the emf generated.

[2 marks]

$$T = 0.25 \text{ s so } \omega = 2\pi / T = 2\pi / 0.25 = 25.1 \text{ rad s}^{-1} \text{ (} f = 4.0 \text{ Hz)}$$

$$\text{Peak emf} = BAN\omega = 1.5 \times 10^{-3} \times 2\pi / 0.25 = 0.0377 \text{ V}$$

$$\text{emf} = \underline{\quad 0.038 \quad} \text{ V}$$

0 5 . 4

Sketch on **Figure 6** the variation with time of flux linkage for the same time interval as **Figure 5**.

[1 mark]**Figure 6**

0 6

A thermal nuclear reactor uses a moderator to lower the kinetic energy of fast-moving neutrons.

0 6 . 1

Explain why the kinetic energy of neutrons must be reduced in a thermal nuclear reactor.

[1 mark]

Slow (thermal) neutrons are much more likely to be absorbed by U-235 nuclei in the fuel, so slowing them increases the probability (chance) of fission.

0 6 . 2

As a result of a collision with an atom of a particular moderator, a neutron loses 63% of its kinetic energy.

A neutron has an initial kinetic energy of 2.0 MeV.

Calculate the kinetic energy of the neutron after five collisions.

[2 marks]

$$\text{After each collision } E = (1 - 0.63)E_{\text{before}} = 0.37 E_{\text{before}}$$

$$\text{After five collisions } E_5 = (0.37)^5 \times E_0$$

$$E_5 = 0.37^5 \times 2.0 \times 10^6 \text{ eV}$$

$$E_5 = 1.39 \times 10^4 \text{ eV} \approx 1.4 \times 10^4 \text{ eV}$$

$$\text{kinetic energy} = \underline{1.4 \times 10^4} \text{ eV}$$

Question 6 continues on the next page

Turn over ►

0	6	.	3
---	---	---	---

The kinetic energy of a neutron in a thermal nuclear reactor is reduced from about 2 MeV to about 1 eV.

Explain why the number of collisions needed to do this depends on the nucleon number of the moderator atoms.

[2 marks]

In a collision, the fraction of kinetic energy (momentum) the neutron loses depends on the masses of the two particles: the neutron loses most energy when the moderator nucleus has a mass close to the neutron's mass.

As the nucleon number of the moderator atoms increases, less energy is lost per collision, so more collisions are required.

0 6 . 4

One fission process which can occur in a thermal nuclear reactor is represented by the equation

Calculate in MeV the energy released in this fission process.

$$\text{mass of } {}_{92}^{235}\text{U} = 235.044 \text{ u}$$

$$\text{mass of } {}_{54}^{142}\text{Xe} = 141.930 \text{ u}$$

$$\text{mass of } {}_{38}^{90}\text{Sr} = 89.908 \text{ u}$$

$$\text{mass of } {}_0^1\text{n} = 1.0087 \text{ u}$$

[3 marks]

$$\text{Mass difference} = (m_{\text{U}} + m_{\text{n}}) - (m_{\text{Xe}} + m_{\text{Sr}} + 4m_{\text{n}})$$

$$= (235.044 + 1.0087) - (141.930 + 89.908 + 4 \times 1.0087)$$

$$= 236.0527 - 235.8728$$

$$= 0.180 \text{ u}$$

$$\text{Energy released} = 0.180 \times 931.5$$

$$= 168 \text{ MeV}$$

energy released = 168 MeV

Question 6 continues on the next page

Turn over ►

0 6 . 5

Many magazine and newspaper articles focus on the risks of using nuclear power.

State **three benefits** of using nuclear power.

[3 marks]

1 *Very little greenhouse gas (CO₂) is emitted, so it contributes less to global warming / climate change.*

2 *A small mass of fuel produces a very large amount of energy, so little fuel is used and the air is cleaner.*

3 *Power is produced continuously (reliably), unlike renewables that depend on sunlight or wind.*

11

END OF SECTION A

Section B

Each of Questions **07** to **31** is followed by four responses, **A**, **B**, **C** and **D**.

For each question select the best response.

Only **one** answer per question is allowed.

For each question completely fill in the circle alongside the appropriate answer.

CORRECT METHOD

WRONG METHODS

If you want to change your answer you must cross out your original answer as shown. 

If you wish to return to an answer previously crossed out, ring the answer you now wish to select as shown. 

You may do your working in the blank space around each question but this will not be marked.
Do **not** use additional sheets for this working.

07 Brownian motion

[1 mark]

- A** makes it possible to see the motion of air molecules. 
- B** is caused by the collisions of smoke particles. 
- C** is caused by collisions between air molecules and smoke particles. 
- D** occurs because air is a mixture of gases and the molecules have different masses.

[1 mark]

A $\frac{P}{\sqrt{2}}$ ☐

B P ☒

C $\sqrt{2} P$ ☐

D $2P$ ☐

2 9

The figure shows an oscilloscope trace of a sinusoidal ac voltage.

The time base setting is 5 ms cm^{-1} and the Y-voltage gain is 10 V cm^{-1} .

Which row describes the ac voltage?

[1 mark]

	rms voltage / V	Frequency / Hz	
A	14	50	☐
B	14	100	☐
C	7	50	☐
D	7	100	☒

A deuterium nucleus and a tritium nucleus fuse together to form a helium nucleus and a particle X. The equation for this process is:

What is X?

[1 mark]

A electron

☐

B neutron

☒

C positron

☐

D proton

☐
3 1

What effect are the control rods intended to have on the average kinetic energy and number of fission neutrons in a thermal nuclear reactor?

[1 mark]

	Average kinetic energy of fission neutrons	Number of fission neutrons	
A	unchanged	unchanged	☐
B	reduced	unchanged	☐
C	unchanged	reduced	☒
D	increased	reduced	☐
