A-level PHYSICS

Paper 2

Time allowed: 2 hours

Materials

For this paper you must have:

- a pencil and a ruler
- a scientific calculator
- a Data and Formulae Booklet
- a protractor.

Instructions

- Use **black ink** or **black ball-point pen**.
- **Fill** in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do **all** rough work in this book. Cross through any work you do not want to be marked.
- Show **all** your working.

Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 85.
- You are expected to use a scientific calculator where appropriate.
- A Data and Formulae Booklet is provided as a loose insert.

Section A

Answer **all** questions in this section.

0 1

Figure 1 shows an electric steam iron.**Figure 1**

Water from a reservoir drips onto an electrically-heated metal plate. The water boils and steam escapes through holes in the metal plate.

The electrical power of the heater inside the iron is 2.1 kW.

Assume that **all** the energy from the heater is transferred to the metal plate.

0 1 . 1

The metal plate has a mass of 1.2 kg and is initially at a temperature of 20 °C. The heater is switched on. After a time t the metal plate reaches its working temperature of 125 °C.

Calculate t .

specific heat capacity of the metal = 450 J kg⁻¹ K⁻¹

[2 marks]

$$\text{Energy supplied} = \text{energy to heat plate: } Pt = mc\Delta\theta$$

$$t = mc\Delta\theta / P = 1.2 \times 450 \times (125 - 20) / 2100$$

$$t = 56\,700 / 2100 = 27 \text{ s}$$

$t =$ 27 s

0 1 . 2

The metal plate is maintained at its working temperature.
Water at 20 °C drips continuously onto the metal plate.
Steam at 100 °C emerges continuously from the iron.

The maker claims that the iron can generate steam at a rate of 60 g min⁻¹.

Determine whether this claim is true.

specific latent heat of vaporisation of water = $2.3 \times 10^6 \text{ J kg}^{-1}$

specific heat capacity of water = $4200 \text{ J kg}^{-1} \text{ K}^{-1}$

[3 marks]

$$\text{In 1 minute: energy supplied} = Pt = 2100 \times 60 = 1.26 \times 10^5 \text{ J}$$

$$Pt = \Delta m c_w \Delta \theta + \Delta m l \quad (\text{heat water to } 100^\circ\text{C, then boil it})$$

$$1.26 \times 10^5 = \Delta m \times 4200 \times (100 - 20) + \Delta m \times 2.3 \times 10^6$$

$$1.26 \times 10^5 = \Delta m \times (3.36 \times 10^5 + 2.3 \times 10^6) = \Delta m \times 2.636 \times 10^6$$

$$\Delta m = 1.26 \times 10^5 / 2.636 \times 10^6 = 0.048 \text{ kg}$$

$$\text{Rate of steam production} = 0.048 \text{ kg min}^{-1} = 48 \text{ g min}^{-1}$$

The iron can only produce 48 g min⁻¹ of steam, which is smaller than
60 g min⁻¹, so the maker's claim is not true.

5

Turn over ►

0 2 . 1

In the kinetic theory model, it is assumed that there are many identical particles moving at random.

State **two** other assumptions made in deriving the equation $pV = \frac{1}{3}Nm (c_{\text{rms}})^2$.

[2 marks]

1 *The volume of the molecules is negligible compared with the volume of the container.*

2 *Collisions are elastic (kinetic energy is conserved), and there are no forces between molecules except during collisions.*

0 2 . 2

Explain why molecules of a gas exert a force on the walls of a container. Refer to Newton's laws of motion in your answer.

[3 marks]

When a molecule hits the wall and bounces back, its direction changes, so its velocity (and momentum) changes.

By Newton's second law (or first law), a change in momentum needs a force, so the wall exerts a force on the molecule ($F = \Delta p / \Delta t$).

By Newton's third law, the molecule exerts an equal and opposite force on the wall. Many molecules hit the wall every second, so there is a steady force on the walls.

0 2 . 3

A sealed flask of volume 0.35 m^3 contains an ideal gas at a pressure of 220 kPa . The mean kinetic energy of the gas molecules is $6.7 \times 10^{-21} \text{ J}$.

Calculate the amount of gas in the container.

[3 marks]

$$E_k = (3/2)kT \quad \text{so} \quad T = 2E_k / 3k$$

$$T = 2 \times 6.7 \times 10^{-21} / (3 \times 1.38 \times 10^{-23}) = 324 \text{ K}$$

$$pV = nRT \quad \text{so} \quad n = pV / RT$$

$$n = 220 \times 10^3 \times 0.35 / (8.31 \times 324) = 28.6 \text{ mol}$$

amount of gas = 28.6 mol

0 2 . 4

Figure 2 shows the variation of pressure with volume for a fixed mass of an ideal gas at constant absolute temperature T .

Draw, on **Figure 2**, the graph for the same gas at temperature $2T$.

[2 marks]

Figure 2

Turn over ►

0 3

An isolated solid conducting sphere is initially uncharged.
Electrons are then transferred to the sphere.

0 3. 1

State and explain the location of the excess electrons.

[2 marks]

*The excess electrons are located on the outer surface of the sphere,
equally spaced (spread out evenly).*

*This is because the electrons all repel each other, so they move as far
apart as possible.*

Figure 3 shows how the electric potential V varies with distance r from the centre of the sphere.

The radius of the sphere is 0.10 m.

Figure 3

0 3 . 2

The magnitude of the electric field strength E is related to V by $E = \frac{\Delta V}{\Delta r}$.

Determine, using this relationship, the magnitude of the electric field strength at a distance 0.30 m from the centre of the sphere.

State an appropriate SI unit for your answer.

[4 marks]

Tangent drawn to the curve at $r = 0.30$ m (on Figure 3):

$$\text{gradient} = \Delta V / \Delta r = (-0.1 - (-1.1)) \times 10^6 / (0.55 - 0.05)$$

$$E = 1.0 \times 10^6 / 0.50$$

$$E = 2.0 \times 10^6 \text{ V m}^{-1}$$

electric field strength = 2.0×10^6 unit V m^{-1}

0 3 . 3

The sphere acts as a capacitor because it stores charge at an electric potential.

Show that the capacitance of the sphere is approximately 1×10^{-11} F.

[3 marks]

$$C = Q / V \text{ and } V = Q / 4\pi\epsilon_0 r \text{ so } C = 4\pi\epsilon_0 r$$

$$C = 4\pi \times 8.85 \times 10^{-12} \times 0.10$$

$$C = 1.1 \times 10^{-11} \text{ F } (\approx 1 \times 10^{-11} \text{ F})$$

Question 3 continues on the next page

Turn over ►

0 3 . 4

Electrons leak away from the sphere with time and the amount of energy stored by the sphere decreases. At one instant, the magnitude of the electric potential of the sphere has fallen to $1.0 \times 10^6 \text{ V}$.

Calculate, for this instant, the change in the energy stored by the sphere.

[3 marks]

Fully charged ($1.8 \times 10^6 \text{ V}$): $E = \frac{1}{2}CV^2$

$E = \frac{1}{2} \times 1.1 \times 10^{-11} \times (1.8 \times 10^6)^2 = 18 \text{ J}$

At $1.0 \times 10^6 \text{ V}$: $E = \frac{1}{2} \times 1.1 \times 10^{-11} \times (1.0 \times 10^6)^2 = 5.5 \text{ J}$

Change in energy = $18 - 5.5 = 12.5 \text{ J}$ (a decrease)

change in energy = 12.5 J

12

0 4

The lines in **Figure 4** show the shape of the gravitational field around two stars **G** and **H**.

Figure 4

0 4 . 1

Compare, with reference to **Figure 4**, the masses of **G** and **H**.

[2 marks]

G has the greater mass: the null point (where the lines from G and H meet) is closer to H than to G.

At the null point the field strength due to G equals that due to H even though G is further away, so G must have more mass ($g = GM / r^2$).

0 4 . 2

X and **Y** are two points in the field.

Annotate **Figure 4** to show the field direction at **X** and the field direction at **Y**.

[1 mark]

Question 4 continues on the next page

Turn over ►

0 4 . 3

A spherical asteroid **P** has a mass of 2.0×10^{20} kg.

The gravitational field strength at its surface is 0.40 N kg^{-1} .

Calculate the radius R of **P**.

[1 mark]

$$g = GM / R^2 \quad \text{so} \quad R = \sqrt{GM / g}$$

$$R = \sqrt{(6.67 \times 10^{-11} \times 2.0 \times 10^{20} / 0.40)}$$

$$R = \sqrt{(3.34 \times 10^{10})} = 1.8 \times 10^5 \text{ m}$$

$$R = \underline{1.8 \times 10^5} \text{ m}$$

0 4 . 4

Sketch, on **Figure 5**, the variation of the gravitational field strength g with distance r . The distance r is measured from the centre of **P**.

[1 mark]

Figure 5

0 4 . 5

Explain what is represented by the area under the graph between $r = R$ and $r = 2R$ on **Figure 5**.

[2 marks]

The area represents the work done per unit mass (energy transferred per kg) when an object is moved from $r = R$ to $r = 2R$, against the gravitational field of P.

This equals the increase in gravitational potential (change in potential ΔV) from R to $2R$.

Question 4 continues on the next page

Turn over ►

Asteroid **P** approaches the two stars **G** and **H**.
Figure 6 shows one position of **P** close to **H**.

Figure 6

0 4 . 6

The gravitational force on **P** from **G** is 6.38×10^{12} N.
The mass of **H** is 3.00×10^{25} kg and the mass of **P** is 2.00×10^{20} kg.
The distance **HP** is 1.50×10^{11} m.

Calculate the magnitude of the acceleration of **P**.

[4 marks]

Force on P from H: $F = GMm / r^2$

$$F_{PH} = 6.67 \times 10^{-11} \times 3.00 \times 10^{25} \times 2.00 \times 10^{20} / (1.50 \times 10^{11})^2$$

$$F_{PH} = 1.78 \times 10^{13} \text{ N}$$

The forces from G and H are at 90° to each other at P, so

$$F_{total} = \sqrt{(1.78 \times 10^{13})^2 + (6.38 \times 10^{12})^2}$$

$$F_{total} = 1.89 \times 10^{13} \text{ N}$$

$$a = F / m = 1.89 \times 10^{13} / 2.00 \times 10^{20}$$

$$a = 9.45 \times 10^{-8} \text{ m s}^{-2}$$

magnitude of acceleration = 9.45×10^{-8} m s⁻²

0 4 . 7

Explain why **P** cannot have a circular orbit around **H**.

[1 mark]

The resultant force on P includes the pull of G as well as H, so it is not continually directed towards the centre of H (no centripetal force towards H).

12

Turn over for the next question

Turn over ►

0 5

Figure 7 shows a transformer.

Figure 7

0 5 . 1

Explain the functions of the core and the secondary coil.

[3 marks]

core *The iron core concentrates (channels) the magnetic flux produced by the primary coil, so it increases the flux linkage with the secondary coil (compared with an air core).*

secondary coil *The alternating current in the primary coil produces a varying (alternating) magnetic flux in the core, which passes through (links with) the secondary coil.*

This changing flux linkage induces an emf in the secondary coil, whose size is determined by the number of turns on the secondary coil (compared with the primary).

0 5 . 2

Figure 8 shows a cross-section through the transformer core. Thin iron sheets are separated by material **M**.

Explain how the efficiency of the transformer is increased by constructing the core in this way.

[3 marks]

Figure 8

Material M is an electrical insulator (high resistivity) and the iron is in thin sheets (laminations).

The changing flux induces emfs in the core, but the insulating layers give a high resistance, so eddy currents in the core are much smaller.

So less energy is wasted heating the core, raising the efficiency.

Figure 9 shows a schematic diagram of a power transmission system.

Figure 9

0 5 . 3

Voltages between 33 kV and 400 kV are used for long-distance transmission.

Suggest why engineers have chosen 132 kV for this system.

[2 marks]

At a lower voltage (e.g. 33 kV) the current would be higher for the same power, so more energy is wasted heating the cables (I^2R).

At a very high voltage (400 kV) insulation is harder and more expensive (taller pylons, costlier transformers), so 132 kV is a compromise.

Question 5 continues on the next page

Turn over ►

0 5 . 4

The industrial consumers use 72 MW of power.
Transformers 1 and 2 each have an efficiency of 98% and the transmission line has an efficiency of 94%.

Calculate the current in the 25 kV line from the power station.

[3 marks]

$$\text{efficiency} = \text{power out} / \text{power in} \quad \text{so} \quad \text{power in} = \text{power out} / \text{efficiency}$$

$$\text{Power into transformer 2} = 72 / 0.98 = 73.5 \text{ MW}$$

$$\text{Power at start of transmission line} = 73.5 / 0.94 = 78.2 \text{ MW}$$

$$\text{Power from power station (25 kV)} = 78.2 / 0.98 = 79.8 \text{ MW}$$

$$I = P / V = 79.8 \times 10^6 / 25 \times 10^3$$

$$I = 3190 \text{ A}$$

$$3.19 \times 10^3$$

current = _____ A

11

0 6

Fission and fusion are two processes that can result in the transfer of binding energy from nuclei.

0 6 . 1

State what is meant by the binding energy of a nucleus.

[2 marks]

The binding energy is the energy required (work done) to separate a nucleus into its individual protons and neutrons (nucleons).

It equals the energy released when the nucleus is formed from its separate nucleons.

0 6 . 2

Calculate, in MeV, the binding energy for a nucleus of iron ${}_{26}^{56}\text{Fe}$.

$$\text{mass of } {}_{26}^{56}\text{Fe nucleus} = 9.288 \times 10^{-26} \text{ kg}$$

[3 marks]

Binding energy $\propto$ mass defect = (mass of nucleons) – (mass of nucleus)

$$\text{Mass of nucleons} = 26m_p + 30m_n$$

$$= 26 \times 1.673 \times 10^{-27} + 30 \times 1.675 \times 10^{-27} = 9.375 \times 10^{-26} \text{ kg}$$

$$\Delta m = 9.375 \times 10^{-26} - 9.288 \times 10^{-26} = 8.70 \times 10^{-28} \text{ kg}$$

$$\Delta m = 8.70 \times 10^{-28} / 1.661 \times 10^{-27} = 0.524 \text{ u}$$

$$\text{Binding energy} = 0.524 \times 931.5 = 488 \text{ MeV}$$

binding energy = 488 MeV

Question 6 continues on the next page

Turn over ►

Figure 10 shows a graph of average binding energy per nucleon against nucleon number for common nuclides.

Figure 10

0 6 . 3

The nuclide labelled **X** in **Figure 10** undergoes fission.

Annotate **Figure 10** with F_1 and F_2 to show **one** possible pair of nuclides resulting from the fission of **X**.

[2 marks]

F_1 has nucleon number about 95 and F_2 about 145; they add up to 240, the nucleon number of X, and both are to the right of the peak.

0 6 . 4

Figure 11 shows a graph of N against Z for stable nuclides.

Figure 11

Deduce the likely initial mode of decay of F_1 and F_2 .
Refer to Figure 11 in your answer.

[3 marks]

Fission fragments are neutron rich: they have a high neutron to proton ratio (about the same as X), so on Figure 11 they lie above (to the left of) the band of stable nuclides.

So the likely initial mode of decay of F_1 and F_2 is β^- decay.

In β^- decay a neutron changes into a proton (neutron number falls by 1, proton number rises by 1), so each nuclide moves down and to the right on Figure 11, closer to the stable region.

10

END OF SECTION A

2 7 A sample of radioactive material consists of 200 g of nuclide **P** and 100 g of nuclide **Q**.

Nuclide **P** has a half-life of 2 days and nuclide **Q** has a half-life of 4 days.

What is the total mass of nuclides **P** and **Q** after 12 days?

[1 mark]

- A** 3.1 g ☐
- B** 12.5 g ☐
- C** 15.6 g ☒
- D** 18.8 g ☐

2 8 A nuclide has a half-life of 10 ms.

The decay constant for this nuclide lies between

[1 mark]

- A** 1 s^{-1} and 10 s^{-1} . ☐
- B** 10 s^{-1} and 10^2 s^{-1} . ☒
- C** 10^2 s^{-1} and 10^3 s^{-1} . ☐
- D** 10^3 s^{-1} and 10^6 s^{-1} . ☐

2 9

Which provides evidence for the existence of energy levels in nuclei?

[1 mark]**A** the Rutherford alpha particle scattering experiment☐**B** the existence of X-ray line spectra☐**C** the existence of gamma radiation☒**D** electron diffraction by crystals☐**3 0**Which is **not** true for gamma radiation?**[1 mark]****A** It is more penetrating than alpha or beta radiation of the same energy through the same material.☐**B** Its intensity is inversely proportional to the square of the distance from its source.☐**C** It is emitted with discrete frequencies.☐**D** When it is absorbed it makes the absorber radioactive.☒**3 1**In a thermal reactor, induced fission occurs when a $^{235}_{92}\text{U}$ nucleus captures a neutron.

Which statement is true?

[1 mark]**A** The moderator absorbs excess neutrons.☐**B** A large number of neutrons should be produced per fission to sustain the reaction.☐**C** Slow neutrons are required for this induced fission.☒**D** The control rods slow down neutrons.☐**25****END OF QUESTIONS**
