Physics

Advanced

PAPER 1: Advanced Physics I

You must have:
Scientific calculator and ruler
Data, Formulae and Relationships Booklet (enclosed)

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
  – *there may be more space than you need.*

Information

- The total mark for this paper is 90.
- The marks for **each** question are shown in brackets
  – *use this as a guide as to how much time to spend on each question.*
- In the question marked with an **asterisk** (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- You are advised to show your working in calculations including units where appropriate.

Pearson

Answer ALL questions.

All multiple choice questions must be answered with a cross in the box ☒ for the correct answer from A to D. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

1 Which of the following is the base unit for charge?

☒ **A** As

☐ **B** C

☐ **C** JV^{-1}

☐ **D** Q

(Total for Question 1 = 1 mark)

2 Which of the following could **not** be accelerated in a LINAC?

☐ **A** electron

☒ **B** helium atom

☐ **C** proton

☐ **D** uranium ion

(Total for Question 2 = 1 mark)

3 A toy car moves up a slope at a constant speed, as shown. The car is moved by a motor with a power output of 5.2 W. The car gains a gravitational potential energy of 0.40 J in a time of 1.1 s.

Which of the following expressions gives the work done, in J, against resistive forces?

☐ **A** $5.2 - (0.40 \times 1.1)$

☒ **B** $(5.2 \times 1.1) - 0.40$

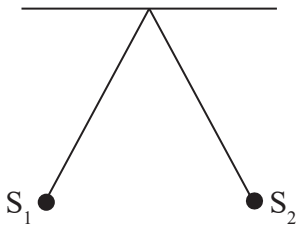

☐ **C** $(5.2 \div 1.1) + 0.40$

☐ **D** $(5.2 \times 1.1) + 0.40$

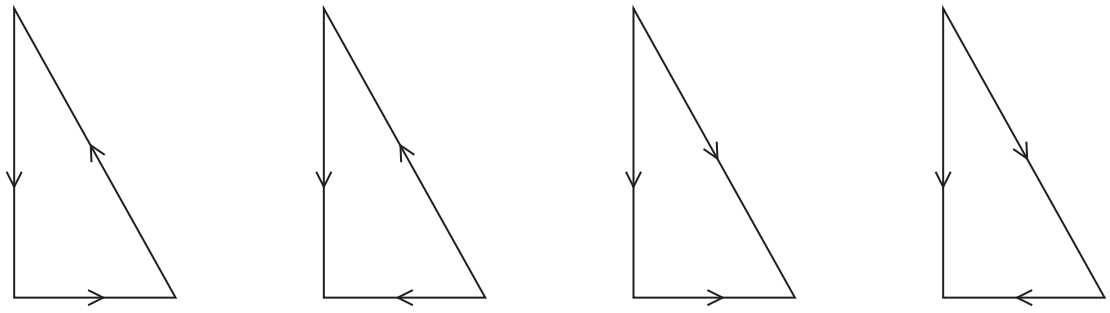

(Total for Question 3 = 1 mark)

Questions 4 and 5 refer to two small positively charged spheres S_1 and S_2 suspended by threads, as shown.

4 Which of the following vector diagrams shows the forces acting on S_2?

A **B** **C** **D**

- ☒ **A**
- ☐ **B**
- ☐ **C**
- ☐ **D**

(Total for Question 4 = 1 mark)

5 The electrostatic force between the two charges is initially F.

The charge on S_1 is doubled whilst the charge on S_2 is unchanged. The distance between S_1 and S_2 doubles.

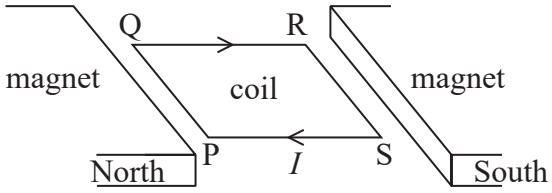

Which of the following is the new force on S_2?

- ☐ **A** $\frac{F}{4}$
- ☒ **B** $\frac{F}{2}$
- ☐ **C** F
- ☐ **D** $2F$

6 A square coil has sides of length l and carries a current I, as shown. The plane of the coil is parallel to a magnetic field of flux density B.

Which row of the table gives the magnetic force on the named side of the coil?

	Named side	Magnetic force
☒ **A**	PQ	*BIl* to the left
☒ **B**	QR	*BIl* to the right
☒ **C**	RS	*BIl* upwards
☒ **D**	SP	*BIl* downwards

(Total for Question 6 = 1 mark)

7 A length of wire has a non-uniform cross-sectional area. There is an electric current in the wire.

Which of the following is **not** constant along the length of this wire?

☒ **A** electric current

☒ **B** electron charge

☒ **C** electron drift velocity

☒ **D** number of free electrons per unit volume

(Total for Question 7 = 1 mark)

8 A roundabout completes 5.0 revolutions in 20 s.

Which of the following is the angular velocity of the roundabout?

☒ **A** 1.6 rad s^{-1}

☒ **B** 16 rad s^{-1}

☒ **C** 25 rad s^{-1}

☒ **D** 630 rad s^{-1}

9 A person of mass 70 kg is standing on the floor of a lift, as shown. The lift is accelerating downwards at 1.5 m s^{-2}.

Which of the following gives the normal reaction R, in N, acting on the person?

- ☒ **A** $R = 70 \times 9.81$
- ☒ **B** $R = 70 \times 1.5$
- ☒ **C** $R = (70 \times 9.81) + (70 \times 1.5)$
- ☒ **D** $R = (70 \times 9.81) - (70 \times 1.5)$

(Total for Question 9 = 1 mark)

10 An object was thrown so that it followed the path shown. Assume drag forces were negligible.

The object was thrown with an initial vertical component of velocity u. The time taken to reach maximum height is t.

Which of the following could **not** be used to determine the maximum vertical height s reached by the object?

- ☒ **A** $s = ut - \frac{1}{2}gt^2$
- ☒ **B** $s = ut$
- ☒ **C** $s = \frac{1}{2}ut$
- ☒ **D** $s = \frac{u^2}{2g}$

(Total for Question 10 = 1 mark)

11 A film involves a gang of bank robbers making a getaway on a bus loaded with gold bars. The bus spins out of control and ends up balancing on the edge of a cliff, as shown.

(Source: © maforche/Shutterstock)

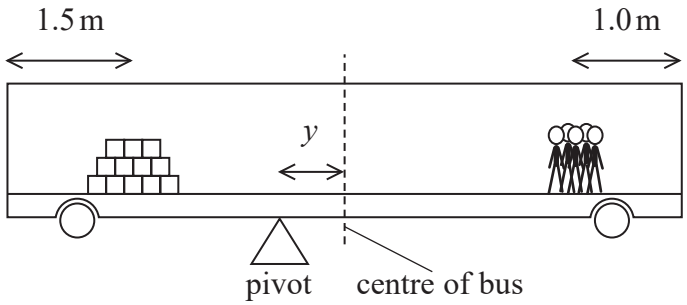

(a) State what is meant by the moment of a force about a point.

(1)

Moment = force × perpendicular distance from the point to the line of action of the force.

(b) The bus is balanced on a pivot that is a distance y from the centre of the bus.

The centre of mass of the gold is 1.5 m from one end of the bus. The centre of mass of the bank robbers is 1.0 m from the other end of the bus, as shown.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

The unloaded bus can be treated as a uniform body with a weight of 32 000 N.

Calculate the distance y when the bus is balanced.

length of bus = 11.0 m
weight of gold bars = 31 000 N
weight of bank robbers = 8700 N

(4)

Centre of bus is 5.5 m from each end, so the gold is 5.5 − 1.5 = 4.0 m and the robbers 5.5 − 1.0 = 4.5 m from the centre.

Distances from pivot: gold (4.0 − y), bus weight y, robbers (4.5 + y).

Moments about pivot: sum of clockwise moments = sum of anticlockwise moments

32 000 N × y + 8700 N × (4.5 + y) = 31 000 N × (4.0 − y)

32 000y + 39 150 + 8700y = 124 000 − 31 000y

71 700y = 84 850, so y = 1.18 m

y = 1.2 m

(Total for Question 11 = 5 marks)

12 Electrical power is transmitted from Norway to Britain using a cable laid under the North Sea.

The following information is published on a website.

> The cable has a diameter of 15 cm and a length of 720 km.
>
> It is made of copper of resistivity $1.7 \times 10^{-8}\,\Omega\,m$.
>
> The electrical power transmitted from Norway is 1400 MW and the transmission potential difference is 1100 kV.
>
> The efficiency of this process is almost 100%.

Deduce, by calculation, whether the claim for efficiency is correct.

$P = VI$, so $I = P/V = 1400 \times 10^6\ W \div 1100 \times 10^3\ V = 1273\ A$

radius $= 0.15\ m \div 2 = 0.075\ m$, $A = \pi r^2 = \pi \times (0.075\ m)^2 = 0.0177\ m^2$

$R = \rho l/A = 1.7 \times 10^{-8}\ \Omega\ m \times 720 \times 10^3\ m \div 0.0177\ m^2 = 0.693\ \Omega$

Power lost in cable $P = I^2R = (1273\ A)^2 \times 0.693\ \Omega = 1.12 \times 10^6\ W = 1.12\ MW$

efficiency = useful power output ÷ total power input

$= (1400 - 1.12)\ MW \div 1400\ MW = 0.9992 = 99.9\ \%$

99.9 % is almost 100 %, so the claim for efficiency is correct.

(Total for Question 12 = 6 marks)

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

13 Beams of antiprotons are often used in particle physics experiments.

(a) Show that the rest mass of an antiproton is about 900 MeV / c^2.

(4)

An antiproton has the same rest mass as a proton, $m = 1.67 \times 10^{-27}$ kg

$E = c^2m = (3.00 \times 10^8 \text{ m s}^{-1})^2 \times 1.67 \times 10^{-27} \text{ kg} = 1.50 \times 10^{-10}$ J

1 MeV = 1.60×10^{-13} J, so $E = 1.50 \times 10^{-10} \text{ J} \div 1.60 \times 10^{-13} \text{ J MeV}^{-1} = 939$ MeV

rest mass = 939 MeV/c^2 ≈ 940 MeV/c^2, which is about 900 MeV/c^2

(b) Antiprotons can be produced by accelerating and colliding two protons moving in opposite directions. A website suggests a possible outcome for a collision between these protons is described by the nuclear equation:

$$p + p \rightarrow p + p + p + \bar{p}$$

Deduce, by using conservation laws, whether it should be possible to produce an antiproton in this way.

(4)

Charge: before +1 + 1 = +2, after +1 + 1 + 1 − 1 = +2, so charge is conserved.

Baryon number: before 1 + 1 = 2, after 1 + 1 + 1 − 1 = 2, so baryon number is conserved.

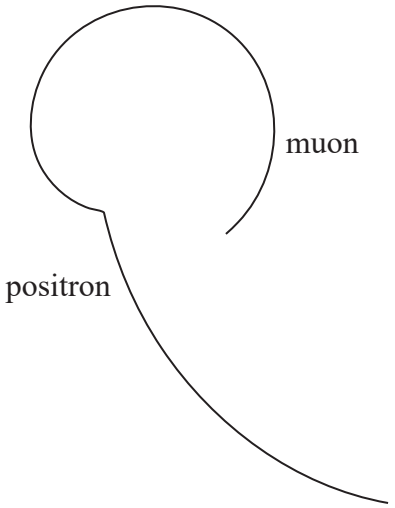

The protons move in opposite directions, so the total momentum is zero; momentum is conserved if the products have zero total momentum.

Extra mass created = 2 × 940 MeV/c^2 = 1880 MeV/c^2. This comes from the kinetic energy of the protons, so it is possible if each beam is accelerated to at least 940 MeV.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

14 The decay of a positive muon produced a positron, an electron neutrino and a muon antineutrino. The diagram shows the tracks formed in a particle detector.

(a) A muon belongs to a family of particles called leptons.

State two features that all particles in the lepton family have in common.

(2)

All leptons are fundamental particles (not made of quarks).

All leptons have a baryon number of 0 (and each lepton has an antiparticle).

(b) Write a nuclear equation for the decay of the muon (μ) described above.

(2)

$\mu^+ \rightarrow e^+ + \nu_e + \bar{\nu}_\mu$

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(c) Describe the role of the magnetic field in a particle detector.

(3)

The magnetic field exerts a force on moving charged particles perpendicular to their velocity (a centripetal force), so their tracks are curved.

The direction of curvature shows whether the charge is positive or negative.

The radius of curvature ($r = p/BQ$) enables the momentum of the particle to be determined.

(d) Explain how the diagram gives evidence that a particle or particles, other than the positron, were produced in this decay.

(4)

The positron's track starts in a different direction from the muon's track, and it has a different radius of curvature.

So the momentum of the positron is different from the momentum of the muon.

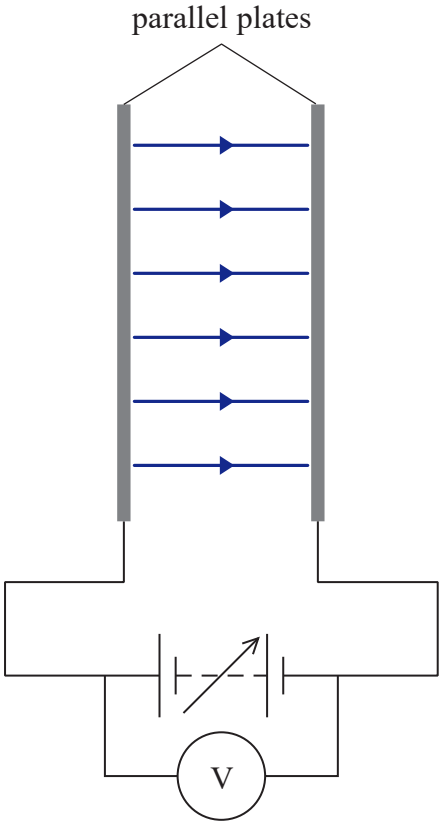

Momentum is conserved in the decay, so the momentum of the positron alone cannot equal that of the muon.

So further particle(s), which are neutral and leave no track (the neutrinos), must have been produced to carry the missing momentum.

DO NOT WRITE IN THIS AREA

15 A teacher demonstrates the electric field produced between two parallel metal plates. The plates are connected to a variable power supply, as shown. The power supply has a very large internal resistance and includes a voltmeter that indicates its output.

(a) (i) Add to the diagram to show the electric field between the two plates.

(3)

(ii) Explain why the reading on the voltmeter indicates the e.m.f. of the power supply.

(2)

The voltmeter has a very high resistance and the plates are separated by an air gap, so no current is drawn from the supply.

So there is no p.d. across the internal resistance (no lost volts) and the terminal p.d. is equal to the e.m.f.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) The power supply output is increased until sparks are heard and are seen in the gap between the plates. Sparks form in air when the electric field strength exceeds $3.0 \times 10^6\,V\,m^{-1}$ and the air becomes conducting for a short time.

(i) Calculate the minimum potential difference across the plates for sparks to be created.

distance between parallel plates = 2.0 mm

(2)

$E = V/d$, so $V = Ed = 3.0 \times 10^6\ V\ m^{-1} \times 2.0 \times 10^{-3}\ m$

$V = 6000\ V$

Minimum potential difference = 6000 V

(ii) Explain why the voltmeter reading decreases significantly whenever sparks are produced.

(3)

When a spark is produced the air conducts, so a current is drawn from the supply.

This current produces a p.d. across the internal resistance of the supply (lost volts).

Terminal p.d. $V = \varepsilon - Ir$: the internal resistance is very large, so Ir is large and the terminal p.d. shown on the voltmeter decreases significantly.

(Total for Question 15 = 10 marks)

16 A student is investigating circuits that include a filament bulb. The filament bulb is labelled '1.5 V, 0.50 W'.

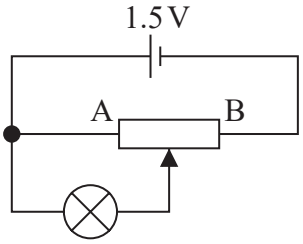

(a) Show that the resistance of the filament bulb when operating normally is about 5 Ω.

(2)

$P = V^2/R$, so $R = V^2/P = (1.5\ V)^2 \div 0.50\ W$

$R = 4.5\ \Omega$, which is about $5\ \Omega$

*(b) The student wishes to control the brightness of the filament bulb using a potentiometer. The student connects the circuit shown. The total resistance of the potentiometer is very much larger than the resistance of the filament bulb.

Explain how the brightness of the filament bulb changes as the potentiometer slider is moved from A to B.

(6)

When the slider is at A, the bulb is connected across zero resistance of the potentiometer, so the p.d. across the bulb is zero and the bulb is not lit.

As the slider moves from A towards B, the resistance of the section of the potentiometer in parallel with the bulb increases and the resistance of the section to the right of the slider, in series with the bulb, decreases.

So the p.d. across the bulb and the current in it increase, and the brightness of the bulb increases as the slider moves towards B.

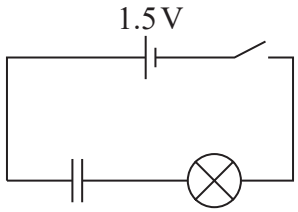

But the potentiometer resistance is much larger than the bulb resistance, so for most of the movement the resistance in series with the bulb is very large and the p.d. across the bulb stays very small: the bulb only lights just before B.

When the slider is at B, the bulb is connected across the whole supply, so the p.d. across it is 1.5 V and it lights normally, at maximum brightness.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(c) The student connects the filament bulb in the circuit shown below. The capacitor is initially uncharged and has a capacitance of 1.2 F.

The resistance of the filament bulb is 5 Ω.

Explain how the brightness of the filament bulb will vary as the switch is closed.

(4)

When the switch is closed the capacitor is uncharged, so the initial p.d. across it is zero and the full 1.5 V is across the bulb: the initial current is maximum and the bulb is bright.

As the capacitor charges, the p.d. across it increases, so the p.d. across the bulb and the current decrease and the bulb gets dimmer.

The current decreases exponentially. Time constant RC = 5.0 Ω × 1.2 F = 6.0 s, so the bulb dims gradually and goes out after about 5RC, about 30 s.

(Total for Question 16 = 12 marks)

DO NOT WRITE IN THIS AREA

17 Over one hundred years ago, Rutherford supervised a series of experiments using a source of alpha particles and thin gold foil.

(a) Describe the model of the atom that Rutherford proposed as a result of this series of experiments.

(3)

The atom is mainly empty space.

Most of the mass of the atom is concentrated in a dense, positively charged nucleus at the centre.

The nucleus is very small compared with the atom, with the electrons orbiting far outside it.

(b) The initial kinetic energy of an alpha $\left({}^{4}_{2}\alpha\right)$ particle is 7.3×10^{-13} J.

(i) In a textbook, it states that an alpha particle with this energy would be brought to rest when it reached a distance of 5.0×10^{-14} m from the centre of the gold nucleus $\left({}^{197}_{79}\text{Au}\right)$.

Deduce whether this statement is correct.

(4)

At closest approach all the kinetic energy has become electric potential energy: $E_k = QV$

with $V = Q_{Au}/4\pi\varepsilon_0 r$

charge of gold nucleus = 79e, charge of alpha particle = 2e

7.30×10^{-13} J = 8.99×10^{9} N m^2 C^{-2} $\times$ 79 $\times$ 1.6×10^{-19} C $\times$ 2 $\times$ 1.6×10^{-19} C $\div$ r

r = 4.98×10^{-14} m $\approx$ 5.0×10^{-14} m, so the textbook statement is correct.

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(ii) Determine the initial momentum of the alpha particle.

(3)

mass of alpha = 4 u = 4 × 1.66 × 10^{-27} kg = 6.64 × 10^{-27} kg

$E_k = p^2/2m$, so $p = \sqrt{(2mE_k)} = \sqrt{(2 \times 6.64 \times 10^{-27}\ kg \times 7.3 \times 10^{-13}\ J)}$

$p = 9.85 \times 10^{-20}$ kg m s^{-1}

Initial momentum = 9.9×10^{-20} kg m s^{-1}

(c) An alpha particle moves along a path directly towards a gold nucleus, as shown.

(i) An elastic interaction occurs and the alpha particle recoils.

State what is meant by an elastic interaction.

(1)

The total kinetic energy is conserved (kinetic energy before = kinetic energy after).

(ii) State what happens to the atoms in the gold foil as a result of these interactions.

(1)

The gold nuclei (atoms) recoil, gaining a little kinetic energy (a small increase in thermal energy of the foil).

18 Regenerative braking supplies a current back to the power transmission system whilst slowing a vehicle. The arrangement shown can be used as a regenerative braking system on a train.

The coil rotates with the wheels of the train. Two copper rings are connected to the ends of the coil. The rings rotate with the coil and two carbon blocks make electrical contact with the rings as they rotate.

(a) Describe how this arrangement can be used as a regenerative brake.

(4)

As the train moves, the wheels turn the coil in the magnetic field, so there is a rate of change of flux linkage with the coil.

By Faraday's law an e.m.f. is induced in the coil; the rings and carbon blocks connect it to the power transmission system, so an induced current is supplied to it.

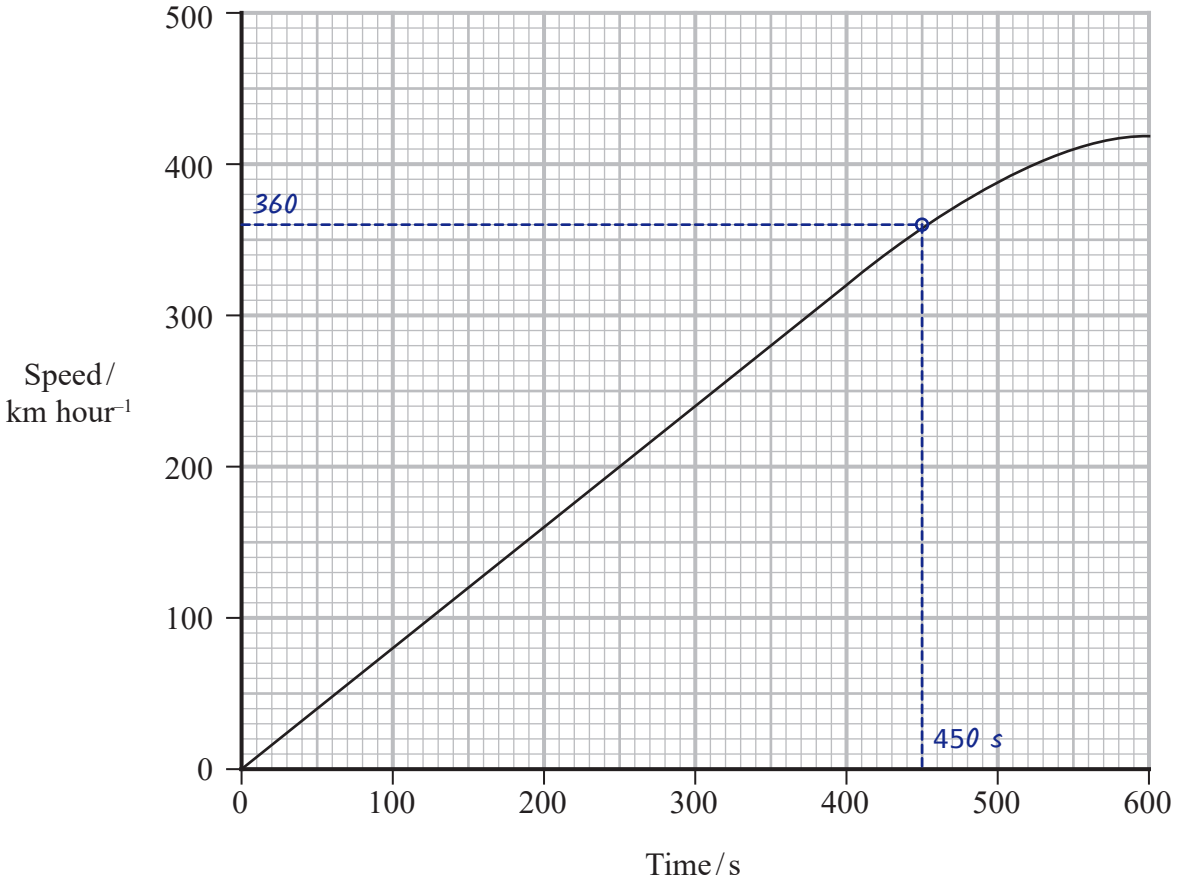

By Lenz's law the induced current opposes the change that produced it, so the force on the current-carrying coil opposes its rotation.

So the wheels slow down (braking), with kinetic energy transferred to electrical energy.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) A specification for a new train states that the train should be able to accelerate to a speed of 360 km hour^{-1} from rest, and that this acceleration should be completed within 40 km of level track.

The graph shows the performance of the train on a test run.

(i) Calculate the acceleration of the train as it accelerates to a speed of 360 km hour^{-1}.

(3)

From the graph, 360 km hour^{-1} is reached at t = 450 s

360 km hour^{-1} = 360 000 m ÷ 3600 s = 100 m s^{-1}

a = gradient = $\Delta v / \Delta t$ = 100 m s^{-1} ÷ 450 s = 0.222 m s^{-2}

Acceleration of train = 0.22 m s^{-2}

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(ii) Deduce whether the performance of the train met the specification on this test run.

(3)

distance = area under graph up to 450 s = ½ × 450 s × 100 m s^{-1}

distance = 22 500 m = 22.5 km

22.5 km is less than 40 km, so the train met the specification on this test run.

(c) On curved tracks there is a maximum safe speed for the train.

(i) Explain why there is a maximum safe speed for a train travelling on a curved track.

(4)

On a curve the train moves in a circle, so a resultant force towards the centre (centripetal force) is required.

This force is provided by the reaction force (and friction) between the wheels and the rails.

The centripetal force needed is $F = mv^2/r$, so it increases with speed.

There is a maximum reaction/friction force from the rails, so above a certain speed it cannot provide the centripetal force and the train leaves the track.

(ii) When the train travels at 200 km $hour^{-1}$, the minimum safe radius of curvature of the track is 1800 m.

Calculate the minimum safe radius of curvature for a speed of 360 km $hour^{-1}$.

(2)

Same maximum force, so v^2/r = constant: $r = 1800\ m \times (360/200)^2$

$r = 1800\ m \times 3.24 = 5832\ m$

Minimum safe radius of curvature = 5800 m

$$n\lambda = d \sin\theta$$

Refractive index

$$n_1 \sin\theta_1 = n_2 \sin\theta_2$$

$$n = \frac{c}{v}$$

Critical angle

$$\sin C = \frac{1}{n}$$

Photon model

$$E = hf$$

Einstein's photoelectric equation

$$hf = \phi + \tfrac{1}{2}mv^2{}_{\text{max}}$$

de Broglie wavelength

$$\lambda = \frac{h}{p}$$

Further mechanics

Impulse

$$F\Delta t = \Delta p$$

Kinetic energy of a non-relativistic particle

$$E_k = \frac{p^2}{2m}$$

Motion in a circle

$$v = \omega r$$

$$T = \frac{2\pi}{\omega}$$

$$F = ma = \frac{mv^2}{r}$$

$$a = \frac{v^2}{r}$$

$$a = r\omega^2$$

$$F = mr\omega^2$$

Fields

Coulomb's law

$$F = \frac{Q_1 Q_2}{4\pi\varepsilon_0 r^2}$$

Electric field strength

$$E = \frac{F}{Q}$$

$$E = \frac{Q}{4\pi\varepsilon_0 r^2}$$

$$E = \frac{V}{d}$$

Electric potential

$$V = \frac{Q}{4\pi\varepsilon_0 r}$$

Capacitance

$$C = \frac{Q}{V}$$

Energy stored in a capacitor

$$W = \tfrac{1}{2}QV$$

$$W = \tfrac{1}{2}CV^2$$

$$W = \tfrac{1}{2}\frac{Q^2}{C}$$

Capacitor discharge

$$Q = Q_0 e^{-t/RC}$$

$$I = I_0 e^{-t/RC}$$

$$V = V_0 e^{-t/RC}$$

$$\ln Q = \ln Q_0 - \frac{t}{RC}$$

$$\ln I = \ln I_0 - \frac{t}{RC}$$

$$\ln V = \ln V_0 - \frac{t}{RC}$$

In a magnetic field

$$F = BIl \sin\theta$$

$$F = Bqv \sin\theta$$

Faraday's and Lenz's laws

$$\mathscr{E} = \frac{-\mathrm{d}(N\phi)}{\mathrm{d}t}$$

Root-mean-square values

$$V_{rms} = \frac{V_0}{\sqrt{2}}$$

$$I_{rms} = \frac{I_0}{\sqrt{2}}$$

Nuclear and particle physics

In a magnetic field

$$r = \frac{p}{BQ}$$

Thermodynamics

Heating

$$\Delta E = mc\Delta\theta$$

$$\Delta E = L\Delta m$$

Molecular kinetic theory

$$\frac{1}{2}m\langle c^2\rangle = \frac{3}{2}kT$$

$$pV = \frac{1}{3}Nm\langle c^2\rangle$$

Ideal gas equation

$$pV = NkT$$

Stefan-Boltzmann law

$$L = \sigma AT^4$$

$$L = 4\pi r^2\sigma T^4$$

Wien's law

$$\lambda_{max}T = 2.898 \times 10^{-3}\ \text{m K}$$

Space

Intensity

$$I = \frac{L}{4\pi d^2}$$

Redshift of electromagnetic radiation

$$z = \frac{\Delta\lambda}{\lambda} \approx \frac{\Delta f}{f} \approx \frac{v}{c}$$

Cosmological expansion

$$v = H_0 d$$

Nuclear radiation

Mass-energy

$$\Delta E = c^2\Delta m$$

Radioactive decay

$$A = \lambda N$$

$$\frac{dN}{dt} = -\lambda N$$

$$\lambda = \frac{\ln 2}{t_{1/2}}$$

$$N = N_0\, e^{-\lambda t}$$

$$A = A_0\, e^{-\lambda t}$$

Gravitational fields

Gravitational force

$$F = \frac{Gm_1m_2}{r^2}$$

Gravitational field strength

$$g = \frac{Gm}{r^2}$$

Gravitational potential

$$V_{grav} = \frac{-Gm}{r}$$

Oscillations

Simple harmonic motion

$$F = -kx$$

$$a = -\omega^2 x$$

$$x = A\cos\omega t$$

$$v = -A\omega\sin\omega t$$

$$a = -A\omega^2\cos\omega t$$

$$T = \frac{1}{f} = \frac{2\pi}{\omega}$$

$$\omega = 2\pi f$$

Simple harmonic oscillator

$$T = 2\pi\sqrt{\frac{m}{k}}$$

$$T = 2\pi\sqrt{\frac{l}{g}}$$
