PAPER 2: Advanced Physics II

You must have:
Scientific calculator and ruler
Data, Formulae and Relationships Booklet (enclosed)

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
  – *there may be more space than you need.*

Information

- The total mark for this paper is 90.
- The marks for **each** question are shown in brackets
  – *use this as a guide as to how much time to spend on each question.*
- In the question marked with an **asterisk (*)**, marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- You are advised to show your working in calculations, including units where appropriate.

Pearson

Answer ALL questions.

All multiple choice questions must be answered with a cross in the box ☒ for the correct answer from A to D. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

1 A Hertzsprung–Russell diagram for stars in our galaxy is shown. V, W, X, Y and Z are positions on the diagram.

Which of the following gives a sequence of positions of the Sun during its lifetime?

☒ **A** V X Z

☒ **B** X W Y

☒ **C** X W Z

☒ **D** Z X V

(Total for Question 1 = 1 mark)

2 A satellite of mass m orbits the Earth with speed v.

What is the speed of a satellite of mass $2m$ orbiting at the same distance from the Earth?

☒ **A** $\frac{v}{2}$

☒ **B** v

☒ **C** $v\sqrt{2}$

☒ **D** $2v$

(Total for Question 2 = 1 mark)

3 The isotope $^{221}_{87}Fr$ undergoes a series of alpha and beta decays before forming $^{205}_{81}Tl$.

Which row of the table shows the number of alpha and beta particles emitted during the decays?

		Alpha	Beta
☒	**A**	3	2
☒	**B**	3	6
☒	**C**	4	2
☒	**D**	4	6

(Total for Question 3 = 1 mark)

4 In an electron diffraction experiment, electrons are accelerated by a potential difference between a hot filament and an anode. The electron beam produced strikes a sample of crystalline material causing a diffraction pattern.

Which of the following would cause the angle of diffraction to increase?

☒ **A** decreasing the distance between the filament and the anode

☒ **B** decreasing the potential difference

☒ **C** increasing the filament temperature

☒ **D** using a crystalline material with a larger lattice spacing

(Total for Question 4 = 1 mark)

5 A particle P has charge and mass. The particle causes an electric field and a gravitational field.

Which of the following statements is correct, at a distance r from P?

☒ **A** gravitational field strength is proportional to $\frac{1}{r}$

☒ **B** electric field strength is proportional to $\frac{1}{r}$

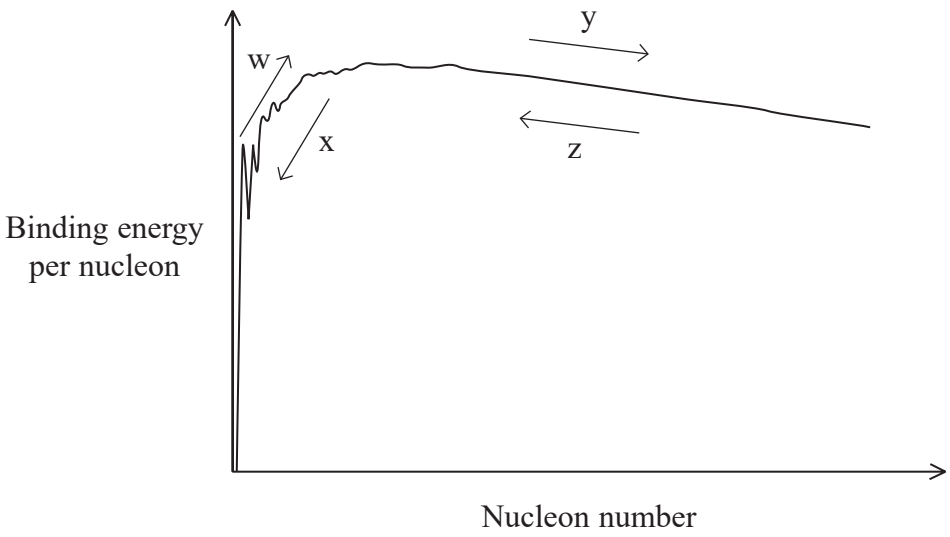

☒ **C** gravitational potential is always positive

☒ **D** electric potential is proportional to $\frac{1}{r}$

11 A student shone green light from a laser through a diffraction grating, producing a diffraction pattern on a screen. The student determined the angle of the third order maximum.

Calculate the wavelength of the green light.

angle of third order maximum = 73.3°
grating spacing = 1.67×10^{-6} m

$n\lambda = d \sin \theta$, with $n = 3$

$3\lambda = 1.67 \times 10^{-6}$ m $\times \sin 73.3°$

$\lambda = 1.67 \times 10^{-6}$ m $\times 0.958 \div 3 = 5.33 \times 10^{-7}$ m

Wavelength = 5.33×10^{-7} m

12 Study of the photoelectric effect leads to observations that cannot be explained by the wave theory of light.

When ultraviolet light is shone on a charged zinc plate, electrons are released.
When visible light is shone on the zinc plate, electrons are not released.

(a) (i) State what is meant by threshold frequency.

(1)

The minimum frequency of light at (or above) which electrons are released from the surface of the metal.

(ii) Explain why the observation of a threshold frequency is **not** consistent with the wave theory of light.

(2)

In the wave theory, energy is delivered continuously, so the energy absorbed by an electron would build up over time.

So an electron would eventually gain enough energy to be emitted at any frequency, even with visible light, which is not observed.

(b) The photoelectric effect can be explained using the idea of photons.

State what is meant by the term photon.

(1)

A photon is a quantum (a discrete packet) of electromagnetic energy.

13 Aldebaran is a red giant star.

For a black body radiator of Aldebaran's surface temperature, the wavelength λ_{max} at which the intensity is maximum is 7.43×10^{-7} m.

Determine the luminosity of Aldebaran.

radius of Aldebaran = 3.14×10^{10} m

Wien's law: $\lambda_{max} T = 2.898 \times 10^{-3}$ m K

$T = 2.898 \times 10^{-3}$ m K $\div$ 7.43×10^{-7} m = 3900 K

$A = 4\pi r^2 = 4\pi \times (3.14 \times 10^{10}\ m)^2 = 1.24 \times 10^{22}\ m^2$

$L = \sigma A T^4 = 5.67 \times 10^{-8}\ W\ m^{-2}\ K^{-4} \times 1.24 \times 10^{22}\ m^2 \times (3900\ K)^4$

$L = 1.63 \times 10^{29}$ W

Luminosity = 1.63×10^{29} W

14 A student used two converging thin lenses in combination to form an image of an object.

(a) Show that the power of the combination of lenses was about 20 D.

focal length of lens 1 = 10 cm
focal length of lens 2 = 15 cm

(3)

$P = 1/f$: $P_1 = 1 \div 0.10\ m = 10\ D$, $P_2 = 1 \div 0.15\ m = 6.7\ D$

$P = P_1 + P_2 = 10\ D + 6.7\ D$

$P = 16.7\ D \approx 17\ D$, which is about 20 D

(b) The object was 4 cm in front of the combination of lenses.

Calculate the image distance.

(2)

$1/u + 1/v = P$: $1/0.04\ m + 1/v = 16.7\ D$

$1/v = 16.7 - 25 = -8.3\ m^{-1}$, $v = -0.12\ m$

Image distance = $-12\ cm$ (virtual)

15 A student wound a piece of string around the head of an electric toothbrush. The student attached a small mass to the other end of the string, as shown in Photograph 1.

Photograph 1

The toothbrush was switched on and the head started to vibrate. The student rotated the toothbrush slowly to unwind the string. At a particular length, large vibrations were observed on the string. The string formed a loop, as shown in Photograph 2.

Photograph 2

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(a) Explain how the vibrations of the toothbrush head caused the loop to form.

(5)

The vibrating toothbrush head sends (transverse) waves down the string, which are reflected at the mass.

The incident and reflected waves travel in opposite directions along the string, meet and superpose.

Where the waves are in antiphase, destructive interference takes place, so there are nodes (zero amplitude) at the ends of the string.

Where the waves are in phase, constructive interference takes place, so the string vibrates with maximum amplitude at the centre, forming an antinode.

This creates a standing (stationary) wave, the loop. This happens at a length where the string's natural frequency equals the toothbrush frequency, so resonance occurs.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) The student continued to unwind the string and the loop disappeared. When the length of the unwound string was twice that shown in Photograph 2 two loops were seen. Three loops were seen when the unwound length was three times that shown in Photograph 2 and so on.

Determine the frequency of vibration of the toothbrush head.

unwound length of string with 4 loops = 0.69 m
mass on string = 0.010 kg
mass per unit length of string = 9.1×10^{-4} kg m^{-1}

(5)

Tension = weight of mass: $T = mg = 0.010\ kg \times 9.81\ N\ kg^{-1} = 0.0981\ N$

$v = \sqrt{(T/\mu)} = \sqrt{(0.0981\ N \div 9.1 \times 10^{-4}\ kg\ m^{-1})} = 10.4\ m\ s^{-1}$

Each loop is half a wavelength, so 4 loops = 2λ: $\lambda = 0.69\ m \div 2 = 0.345\ m$

$v = f\lambda$, so $f = v/\lambda = 10.4\ m\ s^{-1} \div 0.345\ m$

$f = 30\ Hz$

Frequency = 30 Hz

BLANK PAGE

16 On the International Space Station (ISS), astronauts measure their mass once a month using a Body Mass Measurement Device (BMMD).

The BMMD is constructed from a large spring attached to the floor of the ISS, with a platform and handles attached to the spring. The spring is compressed and the astronaut puts his body onto the platform and holds onto the handles, as shown.

(Source: https://www.nasa.gov/content/nasa-astronaut-rick-mastracchio-3)

The spring is released and the astronaut and platform oscillate with simple harmonic motion.

An astronaut used the BMMD. The frequency of oscillation was 0.34 Hz.

(a) Determine the mass of the astronaut.

spring constant = 350 N m^{-1}
mass of platform = 5.7 kg

(4)

$T = 1/f = 1 \div 0.34\ Hz = 2.94\ s$

$T = 2\pi\sqrt{(m/k)}$, so $m = kT^2/4\pi^2 = 350\ N\ m^{-1} \times (2.94\ s)^2 \div 4\pi^2$

$m = 76.6$ kg (total oscillating mass of astronaut + platform)

mass of astronaut = 76.6 kg − 5.7 kg = 70.9 kg

Mass of astronaut = 71 kg

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) The distance between the upper and lower points of the first oscillation is 0.29 m.

(i) Calculate the magnitude of the maximum acceleration of the astronaut.

(4)

amplitude $A = 0.29\ m \div 2 = 0.145\ m$

$\omega = 2\pi f = 2\pi \times 0.34\ Hz = 2.14\ rad\ s^{-1}$

$a_{max} = \omega^2 A = (2.14\ rad\ s^{-1})^2 \times 0.145\ m$

$a_{max} = 0.66\ m\ s^{-2}$

Magnitude of maximum acceleration = $0.66\ m\ s^{-2}$

(ii) Calculate the speed of the astronaut 3.5 s after the start of the oscillations.

(2)

$v = -A\omega \sin \omega t = -0.145\ m \times 2.14\ s^{-1} \times \sin(2.14\ s^{-1} \times 3.5\ s)$ (radians)

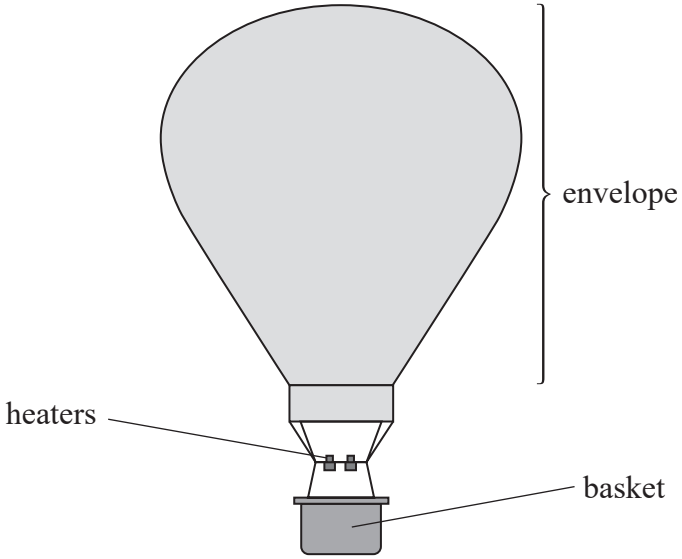

$v = -0.310\ m\ s^{-1} \times \sin(7.48\ rad) = -0.29\ m\ s^{-1}$

Speed = $0.29\ m\ s^{-1}$

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

17 (a) A hot air balloon consists of a fabric envelope, heaters and a basket, as shown.

When the balloon is set up, the envelope is partly filled with air at 20°C. The air is then heated to 120°C and expands to fill the envelope and becomes less dense.

The air pressure inside the envelope is always equal to the air pressure outside the envelope because the envelope is open at the bottom.

The balloon takes off when the upthrust is more than the total weight of the balloon, the air in the envelope and the passengers.

Deduce whether the balloon can take off.

volume of air at 120°C in inflated envelope = 2800 m^3
density of air at 20°C = 1.2 $kg\,m^{-3}$
mass of balloon = 380 kg
mass of passengers = 340 kg
upthrust when the envelope is full = 33 000 N

(6)

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

The mass (number of molecules) of air in the envelope stays the same and p is constant, so from $pV = NkT$, V/T is constant.

$T_1 = 20 + 273 = 293$ K, $T_2 = 120 + 273 = 393$ K

$V_1 = 2800\ m^3 \times 293\ K \div 393\ K = 2087\ m^3$ (volume of this air at 20°C)

$\rho = m/V$: mass of air = $1.2\ kg\ m^{-3} \times 2087\ m^3 = 2505\ kg$

total mass = 2505 kg + 380 kg + 340 kg = 3225 kg

$W = mg = 3225\ kg \times 9.81\ N\ kg^{-1} = 31\ 600\ N$

31 600 N is less than the upthrust of 33 000 N, so the balloon can take off.

(b) (i) State one assumption of the kinetic theory of gases.

(1)

The collisions of the molecules are elastic.

(ii) Derive an equation to show that, for a gas at temperature T,

the mean kinetic energy of the molecules = $\frac{3}{2}kT$

(2)

$pV = NkT$ and $pV = \frac{1}{3}Nm\langle c^2\rangle$, so $\frac{1}{3}Nm\langle c^2\rangle = NkT$

$m\langle c^2\rangle = 3kT$, so $\frac{1}{2}m\langle c^2\rangle = 3/2\ kT$

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(iii) Calculate the root-mean-square speed of nitrogen molecules at a temperature of 120°C.

mass of nitrogen molecule = 28 u

(3)

$m = 28\ u = 28 \times 1.66 \times 10^{-27}\ kg = 4.65 \times 10^{-26}\ kg,\ T = 393\ K$

$\frac{1}{2}m\langle c^2\rangle = 3/2\ kT$, so $\langle c^2\rangle = 3kT/m$

$\langle c^2\rangle = 3 \times 1.38 \times 10^{-23}\ J\ K^{-1} \times 393\ K \div 4.65 \times 10^{-26}\ kg = 3.50 \times 10^5\ m^2\ s^{-2}$

$c_{rms} = \sqrt{(3.50 \times 10^5)} = 590\ m\ s^{-1}$

Root-mean-square speed = $590\ m\ s^{-1}$

(Total for Question 17 = 12 marks)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

18 In 1864, William Huggins and William Miller used dark lines in the spectrum of the Sun to identify elements in the Sun's atmosphere.

*(a) Explain how gases in the Sun's atmosphere cause dark lines in the spectrum corresponding to different elements.

(6)

Electrons in the atoms of the gases can only exist in discrete energy levels.

White light from the Sun's surface passes through the cooler gases; a photon can be absorbed by an electron, which moves to a higher energy level.

The energy of a photon is $E = hf$, so it is proportional to its frequency.

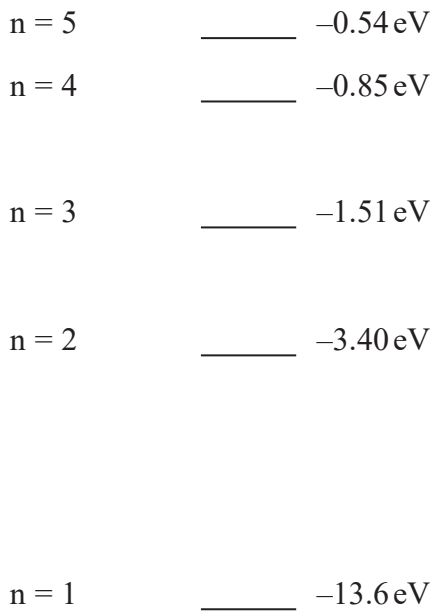

A photon is only absorbed if its energy is exactly equal to the difference between two energy levels.

So only specific frequencies (wavelengths) of light are absorbed, and these are missing from the spectrum, giving dark lines (the re-emitted light goes in all directions).

The energy levels, and so the differences between them, are specific to each element, so each element absorbs a different set of wavelengths and gives its own pattern of dark lines.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) The diagram shows some energy levels of a hydrogen atom.

Not to scale

The absorption spectrum for hydrogen includes a set of lines that all derive from transitions involving the n = 2 energy level. One of these lines is known as the hydrogen-alpha line.

Deduce the transition involved in the formation of the hydrogen-alpha line.

wavelength of hydrogen-alpha line = 656.46 nm

(4)

$f = c/\lambda = 3.00 \times 10^{8}\ m\ s^{-1} \div 656.46 \times 10^{-9}\ m = 4.57 \times 10^{14}\ Hz$

$E = hf = 6.63 \times 10^{-34}\ J\ s \times 4.57 \times 10^{14}\ Hz = 3.03 \times 10^{-19}\ J$

$E = 3.03 \times 10^{-19}\ J \div 1.60 \times 10^{-19}\ J\ eV^{-1} = 1.89\ eV$

$-3.40\ eV + 1.89\ eV = -1.51\ eV$, which is the n = 3 level

So the hydrogen-alpha line is from the transition between n = 2 and n = 3 (electron moves from n = 2 up to n = 3).

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(c) In 1868, William Huggins analysed light from the star Sirius A. The wavelength of the hydrogen-alpha line for light from Sirius A was slightly different from the hydrogen-alpha line observed from a source in a laboratory.

Huggins suggested that this difference could be explained using the Doppler effect and could be used to determine the speed and direction of the star's motion relative to the Earth.

(i) Assess Huggins's suggestion.

(3)

By the Doppler effect, if the star is moving away from the Earth the observed wavelength increases (red shift); moving towards, it decreases.

The change in wavelength is proportional to the star's velocity: $\Delta\lambda/\lambda = v/c$.

So Huggins was correct: the speed and direction of the star's motion (along the line of sight) can be determined.

(ii) Sirius A has a component of velocity away from the Earth of 5.5 km s^{-1}.

The wavelength of the hydrogen-alpha line observed from a source in the laboratory is 656.46 nm.

Calculate the wavelength of the hydrogen-alpha line as seen in the spectrum of Sirius A.

(2)

$\Delta\lambda/\lambda = v/c$, so $\Delta\lambda = 656.46 \times 10^{-9}$ m $\times$ 5.5 $\times 10^{3}$ m $s^{-1} \div 3.00 \times 10^{8}$ m s^{-1}

$\Delta\lambda = 0.012 \times 10^{-9}$ m

Moving away, so the wavelength increases: λ = 656.46 nm + 0.012 nm

Wavelength = *656.47 nm*

(Total for Question 18 = 15 marks)

DO NOT WRITE IN THIS AREA DO NOT WRITE IN THIS AREA DO NOT WRITE IN THIS AREA

19 Nuclear decay is described as being spontaneous and random.

(a) (i) State what is meant by spontaneous and random in this context.

(2)

Spontaneous: the decay is independent of external conditions (e.g. temperature, pressure).

Random: it is not possible to predict when a particular nucleus will decay (or which nucleus will decay next).

(ii) Explain why the decay constant of an isotope can be determined even though nuclear decay is random.

(2)

The probability of a nucleus decaying in a given time (the decay constant) can be determined.

This is because a sample contains a very large number of nuclei, so the probability can be applied accurately.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) A radioactive source used in a school laboratory emits alpha and beta radiation.

Describe how the percentage of the activity due to beta radiation may be determined using a Geiger–Müller tube and ratemeter.

(4)

Measure the background count rate with the GM tube and ratemeter, with no source present.

Place the source close to the GM tube and measure the count rate from the source.

Put a sheet of paper between the source and the tube to absorb the alpha radiation, and measure the count rate again.

Percentage due to beta = (count rate with paper − background) ÷ (count rate from source − background) × 100 %

(c) Americium-241 is used in schools as a source of alpha radiation.
A pure americium-241 source was bought 34 years ago by a school.

(i) Determine the percentage of the initial activity that would be expected today for the americium-241 source.

half-life of americium-241 = 432 years

(3)

$\lambda = \ln 2 / t_{\frac{1}{2}} = 0.693 \div 432 \text{ years} = 1.60 \times 10^{-3} \text{ year}^{-1}$

$A/A_0 = e^{-\lambda t} = e^{\{-(1.60 \times 10^{-3} \text{ year}^{-1} \times 34 \text{ years})\}} = 0.947$

percentage = 0.947 × 100 % = 94.7 %

Expected percentage of initial activity = 95 %

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(ii) The decay products of americium are unstable and undergo a series of further decays.

The table shows the first three decays in this sequence.

Isotope	Decay product	Emission	Half-life
americium-241	neptunium-237	alpha	432 years
neptunium-237	protactinium-233	alpha	2 100 000 years
protactinium-233	uranium-233	beta	27 days

A student states, "Protactinium-233 emits beta particles when it decays, so by now the americium-241 source bought 34 years ago will be emitting a significant amount of beta radiation."

Discuss the student's statement.

(3)

The student is incorrect. Americium-241 and neptunium-237 only emit alpha, so beta is only emitted after neptunium decays to protactinium.

The half-life of neptunium-237 is very long (2 100 000 years), so very little neptunium has decayed.

Also only about 5 % of the americium has decayed, so the proportion of protactinium is very small and the beta emission is not significant.

Electron mass	$m_e = 9.11 \times 10^{-31} \text{ kg}$	
Electronvolt	$1 \text{ eV} = 1.60 \times 10^{-19} \text{ J}$	
Gravitational constant	$G = 6.67 \times 10^{-11} \text{ N m}^2 \text{ kg}^{-2}$	
Gravitational field strength	$g = 9.81 \text{ N kg}^{-1}$	(close to Earth's surface)
Permittivity of free space	$\varepsilon_0 = 8.85 \times 10^{-12} \text{ F m}^{-1}$	
Planck constant	$h = 6.63 \times 10^{-34} \text{ J s}$	
Proton mass	$m_p = 1.67 \times 10^{-27} \text{ kg}$	
Speed of light in a vacuum	$c = 3.00 \times 10^{8} \text{ m s}^{-1}$	
Stefan-Boltzmann constant	$\sigma = 5.67 \times 10^{-8} \text{ W m}^{-2} \text{ K}^{-4}$	
Unified atomic mass unit	$u = 1.66 \times 10^{-27} \text{ kg}$	

Mechanics

Kinematic equations of motion

$$s = \frac{(u + v)t}{2}$$

$$v = u + at$$

$$s = ut + \tfrac{1}{2}at^2$$

$$v^2 = u^2 + 2as$$

Forces

$$\Sigma F = ma$$

$$g = \frac{F}{m}$$

$$W = mg$$

moment of force $= Fx$

Momentum

$$p = mv$$

Work, energy and power

$$\Delta W = F\Delta s$$

$$E_k = \tfrac{1}{2}mv^2$$

$$\Delta E_{grav} = mg\Delta h$$

$$P = \frac{E}{t}$$

$$P = \frac{W}{t}$$

$$\text{efficiency} = \frac{\text{useful energy output}}{\text{total energy input}}$$

$$\text{efficiency} = \frac{\text{useful power output}}{\text{total power input}}$$

Electric circuits

Potential difference

$$V = \frac{W}{Q}$$

Resistance

$$R = \frac{V}{I}$$

Electrical power and energy

$$P = VI$$

$$P = I^2R$$

$$P = \frac{V^2}{R}$$

$$W = VIt$$

Resistivity

$$R = \frac{\rho l}{A}$$

Current

$$I = \frac{\Delta Q}{\Delta t}$$

$$I = nqvA$$

Materials

Density

$$\rho = \frac{m}{V}$$

Stokes' law

$$F = 6\pi\eta rv$$

Hooke's law

$$\Delta F = k\Delta x$$

Young modulus

$$\text{Stress } \sigma = \frac{F}{A}$$

$$\text{Strain } \varepsilon = \frac{\Delta x}{x}$$

$$E = \frac{\sigma}{\varepsilon}$$

Elastic strain energy

$$\Delta E_{\text{el}} = \tfrac{1}{2}F\Delta x$$

Waves and particle nature of light

Wave speed

$$v = f\lambda$$

Speed of a transverse wave on a string

$$v = \sqrt{\frac{T}{\mu}}$$

Intensity of radiation

$$I = \frac{P}{A}$$

Power of a lens

$$P = \frac{1}{f}$$

$$P = P_1 + P_2 + P_3 + \ldots$$

Thin lens equation

$$\frac{1}{u} + \frac{1}{v} = \frac{1}{f}$$

Magnification for a lens

$$m = \frac{\text{image height}}{\text{object height}} = \frac{v}{u}$$

Diffraction grating

$$n\lambda = d \sin\theta$$

Refractive index

$$n_1 \sin\theta_1 = n_2 \sin\theta_2$$

$$n = \frac{c}{v}$$

Critical angle

$$\sin C = \frac{1}{n}$$

Photon model

$$E = hf$$

Einstein's photoelectric equation

$$hf = \phi + \tfrac{1}{2}mv^2_{\text{max}}$$

de Broglie wavelength

$$\lambda = \frac{h}{p}$$

Further mechanics

Impulse

$$F\Delta t = \Delta p$$

Kinetic energy of a non-relativistic particle

$$E_k = \frac{p^2}{2m}$$

Motion in a circle

$$v = \omega r$$

$$T = \frac{2\pi}{\omega}$$

$$F = ma = \frac{mv^2}{r}$$

$$a = \frac{v^2}{r}$$

$$a = r\omega^2$$

$$F = mr\omega^2$$

Fields

Coulomb's law

$$F = \frac{Q_1 Q_2}{4\pi\varepsilon_0 r^2}$$

Electric field strength

$$E = \frac{F}{Q}$$

$$E = \frac{Q}{4\pi\varepsilon_0 r^2}$$

$$E = \frac{V}{d}$$

Electric potential

$$V = \frac{Q}{4\pi\varepsilon_0 r}$$

Capacitance

$$C = \frac{Q}{V}$$

Energy stored in a capacitor

$$W = \tfrac{1}{2}QV$$

$$W = \tfrac{1}{2}CV^2$$

$$W = \tfrac{1}{2}\frac{Q^2}{C}$$

Capacitor discharge

$$Q = Q_0 e^{-t/RC}$$

$$I = I_0 e^{-t/RC}$$

$$V = V_0 e^{-t/RC}$$

$$\ln Q = \ln Q_0 - \frac{t}{RC}$$

$$\ln I = \ln I_0 - \frac{t}{RC}$$

$$\ln V = \ln V_0 - \frac{t}{RC}$$

In a magnetic field

$$F = BIl \sin\theta$$

$$F = Bqv \sin\theta$$

Faraday's and Lenz's laws

$$\mathscr{E} = \frac{-\mathrm{d}(N\phi)}{\mathrm{d}t}$$

Root-mean-square values

$$V_{rms} = \frac{V_0}{\sqrt{2}}$$

$$I_{rms} = \frac{I_0}{\sqrt{2}}$$

Nuclear and particle physics

In a magnetic field

$$r = \frac{p}{BQ}$$

Thermodynamics

Heating

$$\Delta E = mc\Delta\theta$$

$$\Delta E = L\Delta m$$

Molecular kinetic theory

$$\frac{1}{2}m\langle c^2\rangle = \frac{3}{2}kT$$

$$pV = \frac{1}{3}Nm\langle c^2\rangle$$

Ideal gas equation

$$pV = NkT$$

Stefan-Boltzmann law

$$L = \sigma AT^4$$

$$L = 4\pi r^2\sigma T^4$$

Wien's law

$$\lambda_{max}T = 2.898 \times 10^{-3}\ \text{m K}$$

Space

Intensity

$$I = \frac{L}{4\pi d^2}$$

Redshift of electromagnetic radiation

$$z = \frac{\Delta\lambda}{\lambda} \approx \frac{\Delta f}{f} \approx \frac{v}{c}$$

Cosmological expansion

$$v = H_0 d$$

Nuclear radiation

Mass-energy

$$\Delta E = c^2\Delta m$$

Radioactive decay

$$A = \lambda N$$

$$\frac{dN}{dt} = -\lambda N$$

$$\lambda = \frac{\ln 2}{t_{1/2}}$$

$$N = N_0\, e^{-\lambda t}$$

$$A = A_0\, e^{-\lambda t}$$

Gravitational fields

Gravitational force

$$F = \frac{Gm_1m_2}{r^2}$$

Gravitational field strength

$$g = \frac{Gm}{r^2}$$

Gravitational potential

$$V_{grav} = \frac{-Gm}{r}$$

Oscillations

Simple harmonic motion

$$F = -kx$$

$$a = -\omega^2 x$$

$$x = A\cos\omega t$$

$$v = -A\omega\sin\omega t$$

$$a = -A\omega^2\cos\omega t$$

$$T = \frac{1}{f} = \frac{2\pi}{\omega}$$

$$\omega = 2\pi f$$

Simple harmonic oscillator

$$T = 2\pi\sqrt{\frac{m}{k}}$$

$$T = 2\pi\sqrt{\frac{l}{g}}$$
