PAPER 3: General and Practical Principles in Physics

You must have:
Scientific calculator and ruler
Data, Formulae and Relationships Booklet (enclosed)

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
  – *there may be more space than you need.*

Information

- The total mark for this paper is 120.
- The marks for **each** question are shown in brackets
  – *use this as a guide as to how much time to spend on each question.*
- In questions marked with an **asterisk** (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- You are advised to show your working in calculations including units where appropriate.

Pearson

Answer ALL questions in the spaces provided.

1 A student stretched a length of nylon fishing line using the apparatus shown below.

(a) The nylon fishing line was stretched by adding masses to the mass holder. The positions of the bottom of the mass holder were measured as masses were added. For each mass, the extension of the nylon fishing line was calculated. The student recorded the results, as shown in the table.

Mass / kg	Extension / cm
0.05	0.4
0.1	0.8
0.25	2.1
0.5	3.9
0.75	6.0
1.0	7.2

Criticise the recording of these results.

(2)

The positions of the bottom of the mass holder (the raw data) were not recorded, only the calculated extensions.

The masses are not recorded to a consistent number of decimal places (e.g. 0.1 and 1.0 should be 0.10 and 1.00).

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) Describe how the extension of the nylon fishing line could have been determined as accurately as possible.

(3)

Read the metre rule at eye level, perpendicular to the scale, to avoid parallax error.

Bring the metre rule close to the mass holder, and use a set square to read the position of the bottom of the mass holder.

Use a plumb line to check that the metre rule is vertical.

Record the positions when loading and when unloading, and calculate a mean value for each mass.

(c) The strain for the nylon fishing line at its yield point is 0.04

(i) State what is meant by yield point.

(1)

The value of stress at which the line starts to deform plastically, so it does not return to its original length when the force is removed.

(ii) The original length of the nylon fishing line was 2.00 m.

Determine whether the fishing line was stretched beyond its yield point.

(2)

$\varepsilon = \Delta x/x$ so the extension at the yield point is $\Delta x = 0.04 \times 2.00\ m = 0.08\ m = 8$ cm

The maximum extension was 7.2 cm, which is less than 8 cm (strain = 0.072 m ÷ 2.00 m = 0.036 < 0.04), so the line was not stretched beyond its yield point.

2 A student made measurements to determine if some gold coins were made from pure gold. The coins that were available to the student are shown below.

(Source: © Bjoern Wylezich/Shutterstock)

(a) The student used digital calipers to measure the thickness t and the diameter d of one of the coins.

(i) Calculate the volume V of the coin, and the percentage uncertainty in V.

$t = 1.54\,\text{mm}$
$d = 22.16\,\text{mm}$

(7)

$V = \pi r^2 t = \pi \times (22.16 \times 10^{-3}\ m \div 2)^2 \times 1.54 \times 10^{-3}\ m$

$V = 5.94 \times 10^{-7}\ m^3$

Resolution of digital calipers = 0.01 mm, so uncertainty = half the resolution = 0.005 mm

% uncertainty in d = 0.005 mm ÷ 22.16 mm × 100 % = 0.023 %

% uncertainty in area (d^2) = 2 × 0.023 % = 0.045 %

% uncertainty in t = 0.005 mm ÷ 1.54 mm × 100 % = 0.32 %

% uncertainty in V = 0.045 % + 0.32 % = 0.37 %

$V =$ $5.94 \times 10^{-7}\ m^3$

Percentage uncertainty in $V =$ 0.4 %

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(ii) The student measured the mass of the coin using an electronic balance.
The balance had a resolution of 0.1 g.

Assess whether the coin could be made from pure gold.

density of pure gold = $1.93 \times 10^4 \text{ kg m}^{-3}$
mass of coin = 11.2 g

(4)

$\rho = m/V = 11.2 \times 10^{-3}$ kg $\div 5.94 \times 10^{-7}$ $m^3 = 1.89 \times 10^4$ kg m^{-3}

Uncertainty in mass = half resolution = 0.05 g, so % U in m = 0.05 g ÷ 11.2 g × 100 % = 0.45 %

% U in ρ = 0.45 % + 0.37 % = 0.82 %

Maximum density = 1.886×10^4 kg $m^{-3} \times 1.0082 = 1.90 \times 10^4$ kg m^{-3}

1.90×10^4 kg m^{-3} < 1.93×10^4 kg m^{-3}, so even at the top of the uncertainty range the density is less than that of pure gold: the coin is not pure gold.

(b) The student's experimental method could have been improved.

Explain two changes the student could have made to the experimental method.

(4)

Measure the thickness of a stack of coins (e.g. 10) and divide by the number of coins (or measure the mass of a stack of coins).

The uncertainty stays the same but the measured value is larger, so the percentage uncertainty is reduced.

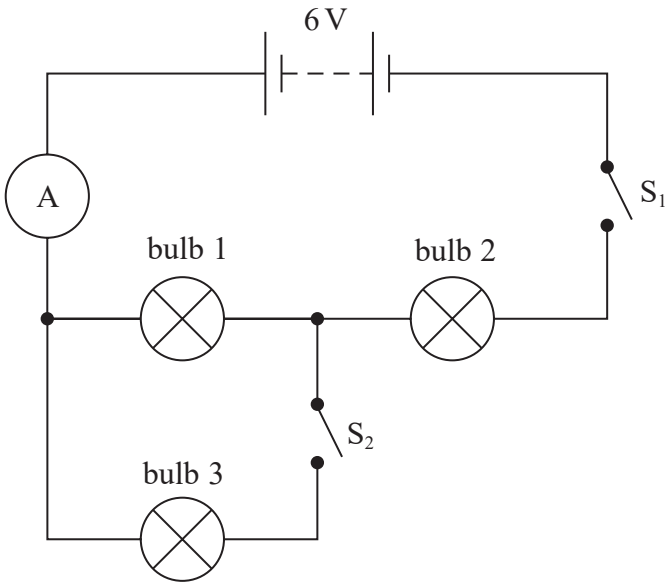

Repeat the measurement of the diameter (and thickness) at different positions on the coin and calculate a mean.

This reduces the effect of random errors.

***3** A student connects three identical 3 V bulbs to a 6 V battery of negligible internal resistance. The circuit includes two switches, S_1 and S_2, as shown.

The student closes S_1 and records the brightness of each bulb.

With S_1 still closed, the student closes S_2.

Explain how the brightness of bulb 1 compares with the brightness of bulb 2 before and after S_2 is closed.

With only S_1 closed, bulbs 1 and 2 are in series, so they have the same current and the same p.d. (3 V each), so bulb 1 and bulb 2 have equal brightness.

Closing S_2 allows current to flow in bulb 3, which is now in parallel with bulb 1 (same p.d. across bulb 3 as bulb 1).

Bulbs 1 and 3 in parallel have a smaller combined resistance than bulb 1 alone, so the total resistance decreases and the current in the circuit (and in bulb 2) increases.

So the p.d. across bulb 2 increases and the p.d. across bulb 1 (and bulb 3) decreases, as the p.d.s add up to 6 V.

$P = V^2/R$, so the power of bulb 2 increases and the power of bulb 1 decreases.

So after S_2 is closed, bulb 1 is not as bright as bulb 2.

BLANK PAGE

4 Helium is available in small metal canisters. The helium can be used to fill party balloons.

(a) A full canister contains helium gas at a temperature of 18.5°C and a pressure of 1.65×10^{7} Pa. The canister is approximately spherical, with a radius of 4.36×10^{-2} m.

Calculate the mass of helium gas in the full canister.

mass of 6.02×10^{23} atoms of helium = 4.00×10^{-3} kg

(5)

$V = 4/3\ \pi r^3 = 4/3 \times \pi \times (4.36 \times 10^{-2}\ m)^3 = 3.47 \times 10^{-4}\ m^3$

$T = 18.5 + 273 = 291.5\ K$

$pV = NkT$ so $N = pV/kT = (1.65 \times 10^{7}\ Pa \times 3.47 \times 10^{-4}\ m^3) \div (1.38 \times 10^{-23}\ J\ K^{-1} \times 291.5\ K)$

$N = 1.42 \times 10^{24}$ atoms

$m = (1.42 \times 10^{24} \div 6.02 \times 10^{23}) \times 4.00 \times 10^{-3}\ kg = 9.46 \times 10^{-3}\ kg$

Mass of helium = 9.46×10^{-3} kg

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(b) Student X and Student Y discuss the weight of the canister and its contents after a number of balloons have been filled.

Student X suggests that the weight will have increased, because the upthrust exerted on the canister by the helium will be reduced.

Student Y suggests that the weight will have decreased, because helium has been released from the canister.

Assess which student's suggestion is correct.

(4)

The upthrust on the canister equals the weight of air (fluid) displaced by the canister.

The volume of the canister stays constant, so the upthrust on the canister remains constant, and Student X is incorrect.

The mass of helium gas in the canister decreases as helium is released.

Hence the weight of the canister and its contents decreases, and Student Y is correct.

5 A student used springs to attach a trolley between two fixed supports, as shown.

When displaced horizontally, the trolley oscillated with simple harmonic motion.

To determine the time period T of oscillation of the trolley, the student displaced the trolley from its equilibrium position and released it. As she released the trolley, she started a stopwatch. She stopped the stopwatch when the trolley had returned to its starting point.

(a) Explain how the procedure used by the student to determine T could have been improved.

(6)

Time a number of complete oscillations (e.g. 10), divide by the number of oscillations, and repeat to calculate a mean time period.

This reduces the effect of random error (such as reaction time) and reduces the percentage uncertainty in T.

Allow the oscillation to settle before starting to time.

Use a fiducial marker, so it is easier to see when the trolley passes a fixed point.

Start and stop timing at the mid-point (equilibrium position) of the oscillation.

The trolley is travelling fastest at the mid-point, so the effect of reaction time is reduced.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) The mass of the trolley was M. The student added a small mass m to the trolley and determined the new value of T. She repeated the procedure for a range of values of m.

She plotted a graph of T^2 against m.

Explain how she could use her graph to determine a value for M.

(4)

For a mass on a spring $T = 2\pi\sqrt{((M + m)/k)}$

So $T^2 = (4\pi^2/k)m + 4\pi^2M/k$, which is in the form $y = mx + c$

The gradient of the graph is $4\pi^2/k$, so calculate a value for k from the gradient.

The y-intercept is $4\pi^2M/k$, so M = y-intercept $\times$ $k/4\pi^2$ (= y-intercept $\div$ gradient).

6 Rosslyn Chapel is a 15th century chapel in Scotland. Inside the chapel, small sandstone cubes protrude from a number of arches. It has been suggested that carvings on these cubes bear a resemblance to standing wave patterns that can be produced on a vibrating metal plate.

A metal plate is made to vibrate and sand is scattered evenly across its surface. At a certain frequency the sand moves to produce the standing wave pattern shown below.

(Source: https://skullsinthestars.com/2013/05/02/physics-demonstrations-chladni-patterns/#jp-carousel-7353)

(a) Explain why the sand moves to different positions when a standing wave is formed on the plate.

(3)

A standing wave has nodes (zero amplitude) and antinodes (maximum amplitude) on the plate.

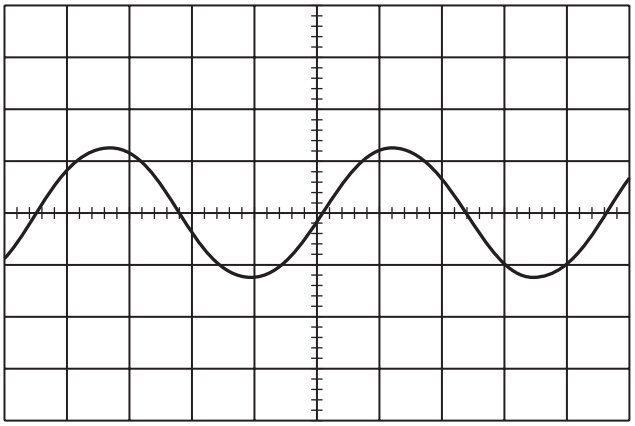

The sand is displaced away from the antinodes, where the plate vibrates most.

The sand collects at the nodes, where the plate does not vibrate.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) The plate is set into movement by a vibration generator. The wavelength of the waves produced in the plate was estimated to be 0.32 m.

The signal applied to the vibration generator is shown on the oscilloscope trace below. The time base of the oscilloscope was set to 0.50 ms div^{-1}.

The waves produced in the plate travel at a speed much less than the speed of sound in air.

Evaluate whether the data supports a value for the speed of waves in the plate that is much less than the speed of sound in air.

speed of sound in air = 340 m s^{-1}

(5)

One full cycle on the trace = 4.6 div

$T = 4.6 \text{ div} \times 0.50 \text{ ms div}^{-1} = 2.3 \text{ ms} = 2.3 \times 10^{-3} \text{ s}$

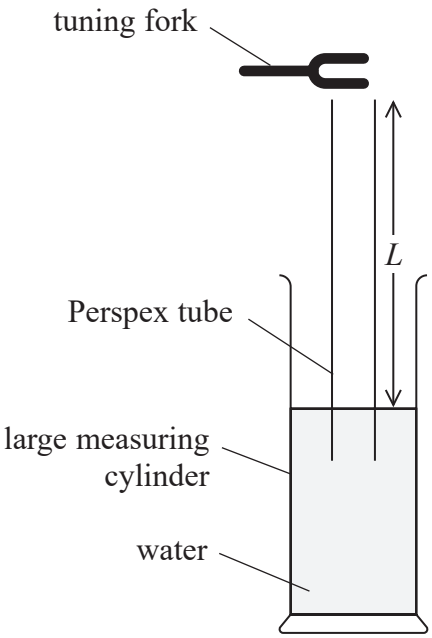

$f = 1/T = 1 \div 2.3 \times 10^{-3} \text{ s} = 435 \text{ Hz}$

$v = f\lambda = 435 \text{ Hz} \times 0.32 \text{ m} = 139 \text{ m s}^{-1} \approx 140 \text{ m s}^{-1}$

140 m s^{-1} is much less than 340 m s^{-1}, so the data supports a speed much less than the speed of sound in air.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(c) The speed of sound in air can be determined by creating a standing wave in a column of air. The diagram shows a tuning fork just above the open end of a tube.

The tuning fork produces a sound wave of known frequency f. Several tuning forks are available, each with a different frequency.

A student adjusted the length L of the air column. A loud sound was heard when a standing wave was produced. A node was formed at the water surface, and an antinode was formed at the open end of the tube.

The student used values of L and f to determine a value for the speed of sound.

Describe a graphical method that the student could have used to determine a value for the speed of sound.

(3)

With a node at the water and an antinode at the open end, $L = \lambda/4$, so $\lambda = 4L$

$v = f\lambda = 4fL$, so $L = v/4f$: plot a graph of L against $1/f$ for the different tuning forks.

This gives a straight line through the origin with gradient $v/4$, so speed of sound v = 4 × gradient.

DO NOT WRITE IN THIS AREA

BLANK PAGE

7 Radon is a radioactive gas. One isotope of radon, $^{220}_{86}Rn$, decays to polonium, Po, by emitting an alpha particle.

(a) Complete the nuclear equation for the decay of radon.

(2)

$$^{220}_{86}Rn \rightarrow \ ^{216}_{84}Po + \ ^{4}_{2}\alpha$$

(b) Radon is produced in the ground and escapes into the atmosphere.

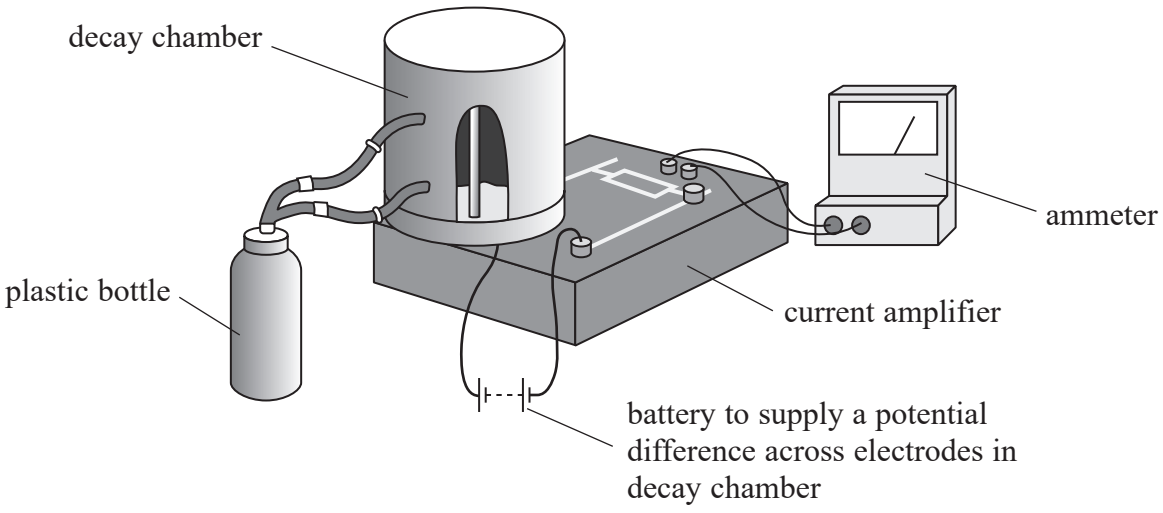

Explain why this is a safety hazard.

(2)

Radon gas can be breathed in, and once inside the body the alpha particles can damage living cells (causing mutations or cancer).

This is because alpha particles are highly ionising.

(c) The diagram shows apparatus for monitoring the decay of radon in the laboratory. Radon gas is produced in the plastic bottle from the decay of radium. A small amount of radon is then inserted into the decay chamber by squeezing the plastic bottle.
A current is produced between two electrodes inside the chamber. This current is amplified and recorded by the ammeter.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(i) Explain why a current is produced in the decay chamber.

(2)

The alpha particles ionise the air inside the chamber.

This produces (moving) electrons and ions inside the chamber, which are attracted to the oppositely charged electrodes, giving a current.

(ii) A teacher is demonstrating the operation of the decay chamber to her class. She squeezes the bottle to introduce radon into the chamber.

She claims that within 450 s the activity of the radon in the chamber will be less than 1% of its initial value.

Assess whether her claim is correct.

half-life of radon = 55.6 s

(3)

$\lambda = \ln 2 / t_{\frac{1}{2}} = 0.693 \div 55.6\ s = 0.0125\ s^{-1}$

$\lambda t = 0.01247\ s^{-1} \times 450\ s = 5.61$

$A = A_0 e^{-\lambda t}$ so $A/A_0 = e^{-5.61} = 0.0037$

% activity remaining = 0.37 %, which is less than 1 %, so her claim is correct.

8 A student investigated the behaviour of a pendulum. The student used a 'spring gun' to fire a small sphere of modelling clay at the wooden pendulum bob, as shown in Figure 1. The clay stuck to the pendulum bob, which swung to one side, as shown in Figure 2.

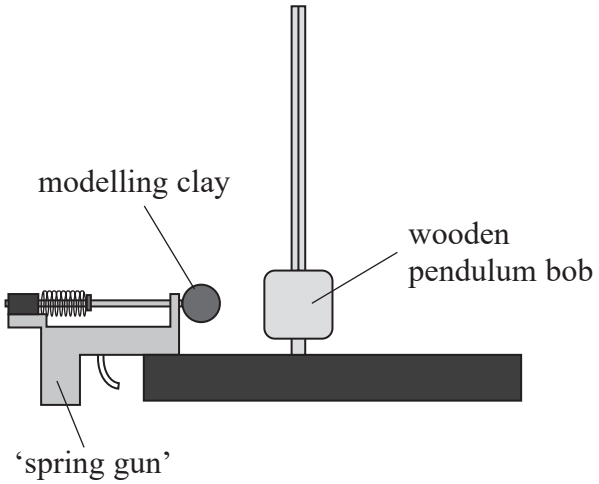

Figure 1

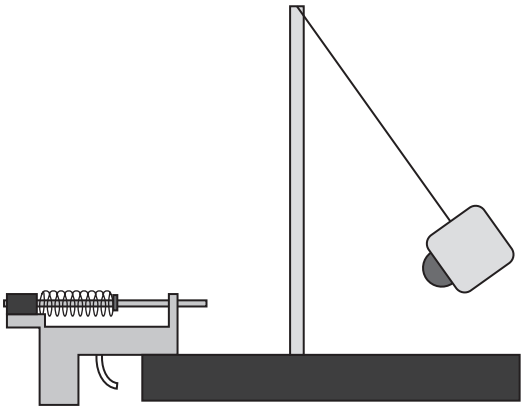

Figure 2

*(a) Describe how the principle of energy conservation and the principle of momentum conservation apply to this situation.

Consider the situation from the instant the spring gun is released to the instant the bob reaches its maximum height.

(6)

When the spring gun is released, the elastic potential energy of the spring is transferred to kinetic energy of the modelling clay.

So the clay has momentum before it hits the bob (the bob is stationary, with zero momentum).

Momentum is conserved when the clay hits the bob: the momentum of the clay before equals the momentum of the clay and bob together after the collision.

Kinetic energy is transferred from the clay to the bob, which moves off with the clay.

The collision is inelastic, so kinetic energy is not conserved: some energy is transferred to thermal energy as the clay deforms, but total energy is conserved.

At the maximum height of the bob, all the kinetic energy (after the collision) has been transferred to gravitational potential energy.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) When the modelling clay hits the pendulum bob, the pendulum swings to one side.

(i) Show that the time taken for the pendulum bob to move from its lowest position to its highest position is about 0.6 s.

effective length of pendulum = 1.25 m

(3)

$T = 2\pi\sqrt{(l/g)} = 2\pi \times \sqrt{(1.25\ m \div 9.81\ m\ s^{-2})} = 2.24\ s$

Lowest to highest position is a quarter of an oscillation, so time = T/4

Time = 2.24 s ÷ 4 = 0.56 s, which is about 0.6 s

(ii) The pendulum bob was then attached to a spring of stiffness 0.12 N m^{-1}. When the bob was displaced vertically and released, it oscillated with a time period equal to that of the pendulum.

Calculate the mass of the pendulum bob.

(2)

$T = 2\pi\sqrt{(m/k)}$ so $m = k(T/2\pi)^2$

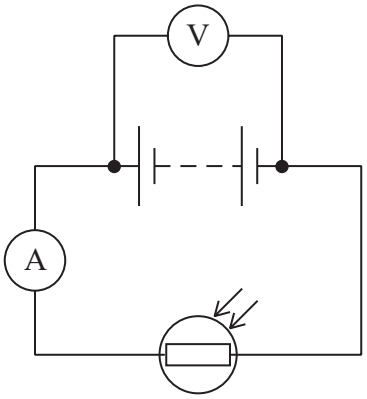

$m = 0.12\ N\ m^{-1} \times (2.24\ s \div 2\pi)^2 = 0.0153\ kg$

Mass of pendulum bob = 0.015 kg

DO NOT WRITE IN THIS AREA

9 A student carried out an experiment with a light dependent resistor (LDR). He connected the LDR in series with an ammeter and a power supply, as shown in the circuit diagram.

The student placed the LDR a known distance from a desk lamp, as shown.

The student noted the reading on the ammeter as he brought the LDR closer to the lamp.

(a) The student planned to vary the intensity of light incident upon the LDR by adjusting the distance x between the LDR and the lamp.

He thought that the intensity of light on the LDR would increase uniformly if he decreased x by equal intervals. He therefore planned to take ammeter readings as he decreased x from 20.0 cm to 10.0 cm in equal intervals.

(i) Criticise the student's plan for data collection.

(3)

The intensity of light varies as an inverse square law, $I = P/4\pi x^2$, so decreasing x by equal intervals will not increase the intensity uniformly.

The student should decrease the distance at decreasing intervals.

He should use a greater range of distances, as the lamp is not a point source.

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(ii) Explain one precaution that the student should take to ensure that results are accurate.

(2)

Carry out the experiment in a darkened room (subdued lighting).

This is because ambient (background) light would also fall on the LDR and increase the ammeter reading.

(b) Explain why the ammeter reading increased as the LDR was brought closer to the lamp. Your answer should include reference to the charge carriers in the LDR.

(3)

Photons incident upon the LDR release conduction electrons (promote electrons into the conduction band).

As the LDR gets closer to the lamp, more photons are incident per second, so the number of free electrons (charge carriers) per unit volume, n, increases.

$I = nqvA$, so the current increases.

10 A ‘jumperoo’ is a harness, suspended by a vertical spring, into which a baby can be placed, as shown.

The jumperoo is adjusted so that the baby’s feet are a few centimetres above the floor. If the baby is then displaced downwards and released, he oscillates vertically.

(a) The graph shows how the acceleration a of the baby depends upon the displacement x of the baby from its equilibrium position.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

For safety reasons, it is suggested that the maximum velocity of the baby should not exceed $0.5\,m\,s^{-1}$.

Assess whether it is safe for the baby to oscillate in the jumperoo with an amplitude of 22 cm.

(3)

From the graph, $a = -20\ cm\ s^{-2}$ when $x = 5.0\ cm$

$a = -\omega^2 x$ so $\omega = \sqrt{(20\ cm\ s^{-2} \div 5.0\ cm)} = 2.0\ s^{-1}$

$v = \omega A \sin \omega t$, so $v_{max} = \omega A = 2.0\ s^{-1} \times 0.22\ m = 0.44\ m\ s^{-1}$

$0.44\ m\ s^{-1} < 0.5\ m\ s^{-1}$, so it is safe to oscillate at this amplitude.

(b) The amplitude of the oscillations quickly decreases, so the baby has to push down on the floor to maintain the oscillations.

When the baby pushes at a particular frequency, the amplitude of oscillation increases to a maximum.

A baby of greater mass is placed in the jumperoo.

This baby pushes on the floor at a frequency that produces a maximum amplitude of oscillation.

Explain how this frequency compares with the frequency of pushing of the original baby.

A calculation is not necessary.

(3)

The pushing frequency must match the natural frequency of the jumperoo for maximum amplitude (resonance).

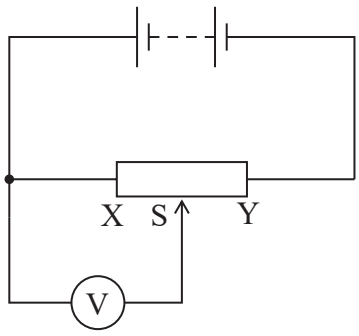

With a greater mass, the time period of oscillation increases, as $T = 2\pi\sqrt{(m/k)}$, so the natural frequency is lower.

So the frequency of pushing must decrease.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

11 A student connected a voltmeter to a potential divider, as shown in the circuit diagram.

(a) The potential divider was adjusted by moving sliding contact S from position X to position Y.

Explain how the voltmeter reading V depends upon the position of S.

(3)

When S is at end X, V is zero; when S is at end Y, V equals the supply p.d.

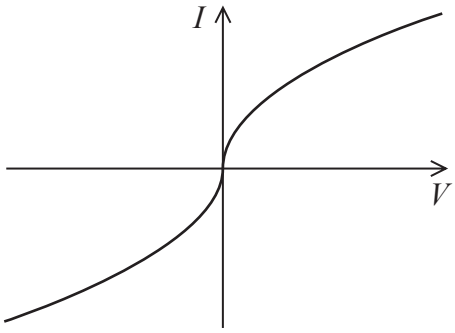

The resistance between X and S is proportional to the length XS, so the supply p.d. is divided in proportion to the resistance to the left and right of S.

So V increases (uniformly) as S moves from X to Y.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

(b) A filament bulb and ammeter were connected to the potential divider. The potential divider was used to vary V across the filament bulb. The ammeter gave the corresponding current I in the filament.

I varied with V, as shown in the graph below.

Explain the shape of the graph.

(2)

As V increases, I increases, so the temperature of the filament increases.

So the resistance of the filament increases, so the increase in current per unit increase in p.d. decreases (the gradient decreases).

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(c) The temperature T of the filament varies with the potential difference V across the filament according to the expression

$$T = aV^b$$

where a and b are constants.

(i) Explain why a graph of $\log T$ against $\log V$ would give a straight line.

(2)

log T = log a + b log V, i.e. log T = b log V + log a

Compare with y = mx + c: the gradient is b and the intercept is log a, which are both constants, so the graph is a straight line.

(ii) Data for T and V is shown in the table below.

T / K	V / V	log (V / V)	log (T / K)
1480	5.03	0.702	3.170
1680	6.89	0.838	3.225
1850	8.95	0.952	3.267
2010	11.11	1.046	3.303
2140	12.94	1.112	3.330
2280	15.06	1.178	3.358

Plot a graph of $\log T$ against $\log V$ on the grid opposite. Use the extra columns provided to show any processed data.

(5)

(iii) Determine a value for b using your graph.

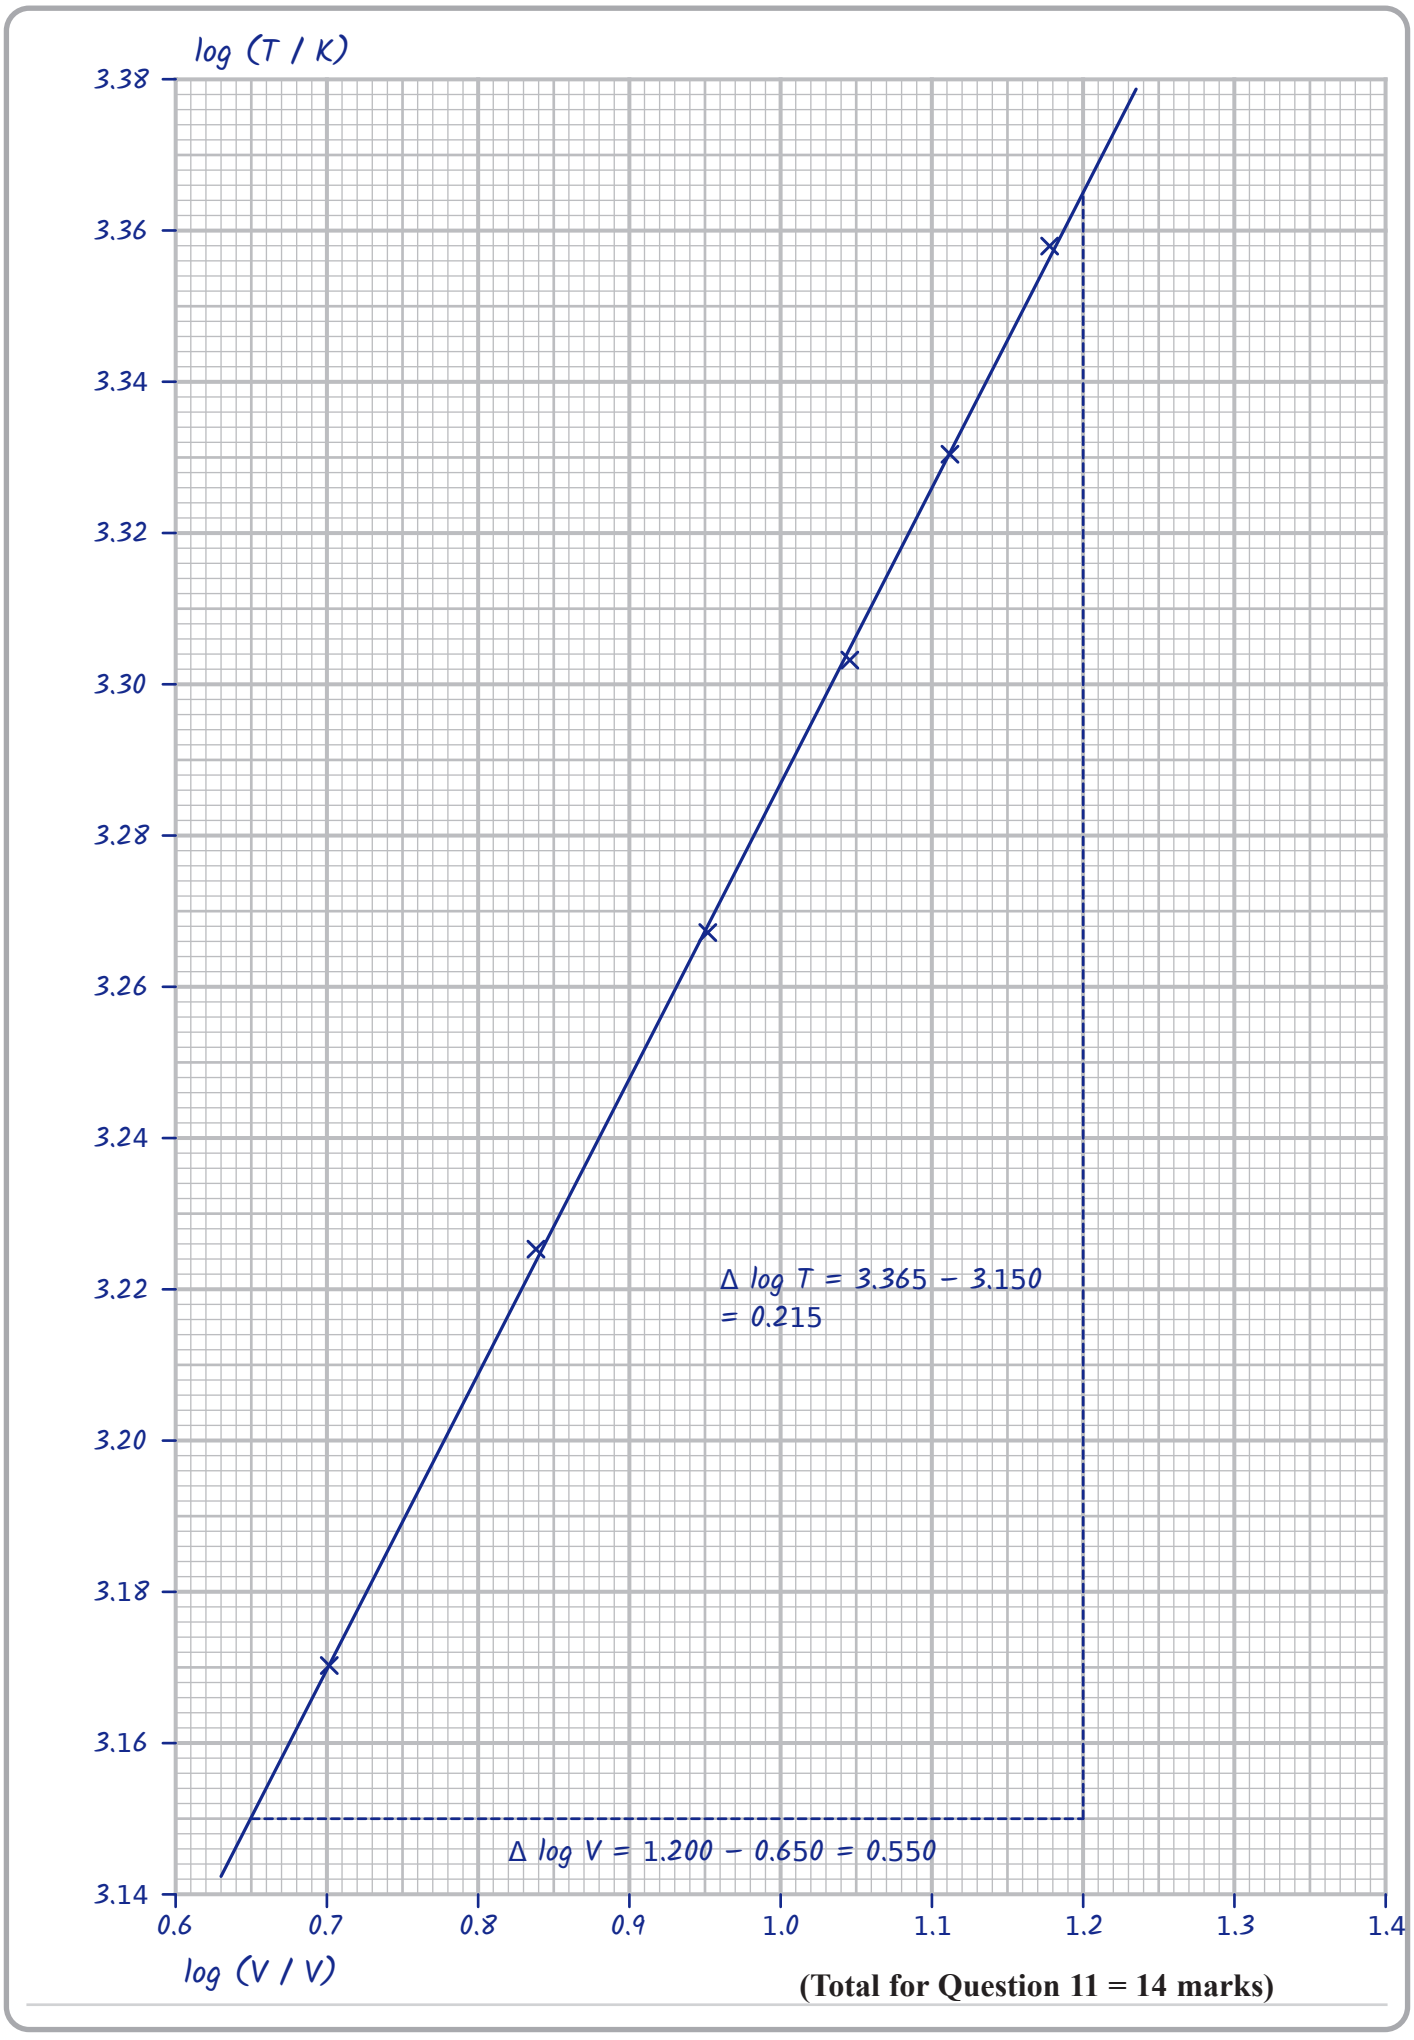

(2)

Gradient (large triangle) = (3.365 − 3.150) ÷ (1.200 − 0.650) = 0.215 ÷ 0.550 = 0.391

b = gradient = 0.39

b = 0.39

12 Chocolate is a solid at room temperature, but melts just below body temperature.

(a) A student investigated the viscosity of some melted chocolate using a falling-ball method. Since chocolate is opaque, a thin rod was attached to the ball so that the movement of the ball could be monitored. The apparatus is shown in the diagram.

The chocolate was maintained at a constant temperature during the investigation.

(i) The student used a stopwatch to measure the time t for the ball to fall 22.5 cm whilst travelling at its terminal velocity v.

Her results are shown in the table.

t_1 / s	t_2 / s	t_3 / s
9.6	9.9	9.6

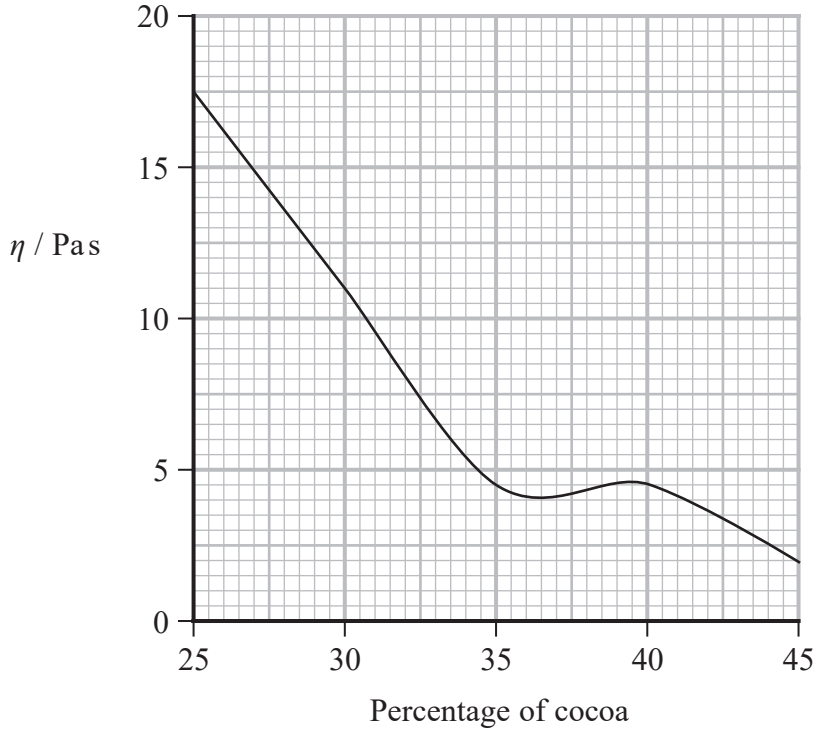

v is given by the formula

$$v = \frac{2r^2 g(\rho_B - \rho_C)}{9\eta}$$

where
r is the radius of the ball
ρ_B is the density of the ball
ρ_C is the density of the chocolate
η is the viscosity of the chocolate.

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

The graph is taken from a commercial website. It shows how, at the temperature of the experiment, η depends on the percentage of cocoa in the chocolate.

The chocolate wrapper indicated that the chocolate had a 35% cocoa content.

Assess whether the student's timing data supports this percentage cocoa content.

$r = 4.25 \times 10^{-3}\,\text{m}$
$\rho_B = 7750\,\text{kg m}^{-3}$
$\rho_C = 1330\,\text{kg m}^{-3}$

(5)

Mean t = (9.6 + 9.9 + 9.6) s ÷ 3 = 9.7 s

$v = s/t$ = 0.225 m ÷ 9.7 s = 0.0232 m s^{-1}

$\eta = 2r^2g(\rho_B - \rho_C)/9v$ = 2 × $(4.25 \times 10^{-3}\ m)^2$ × 9.81 m s^{-2} × (7750 − 1330) kg m^{-3} ÷ (9 × 0.0232 m s^{-1})

η = 10.9 Pa s, so from the graph the cocoa content is about 30 %

At 35 % cocoa the viscosity would be about 4.5 Pa s, so the timing data does not support a 35 % cocoa content.

(ii) Explain one reason why the student's data may have led to an inaccurate conclusion about the cocoa content.

(2)

The temperature of the chocolate may not have been constant (e.g. it cooled as the ball fell).

So the viscosity value would have varied, as viscosity depends strongly on temperature.

(b) One type of chocolate melts at a temperature of 32°C.

The energy released when 65 g of this chocolate is digested is 345 kcal.

It is suggested that the energy used to melt a piece of this chocolate is at least 15% of the energy released when the chocolate is digested.

Assess the accuracy of this suggestion.

initial temperature of chocolate = 15°C
specific heat capacity of chocolate = 3.9×10^3 J kg^{-1} K^{-1}
specific latent heat of chocolate = 1.50×10^5 J kg^{-1}
1 kcal = 4200 J

(6)

Energy to heat to melting point: $\Delta E = mc\Delta\theta = 0.065$ kg $\times$ 3.9 $\times 10^3$ J kg^{-1} K^{-1} $\times$ (32 − 15) K = 4.31×10^3 J

Energy to melt: $\Delta E = mL = 0.065$ kg $\times$ 1.50 $\times 10^5$ J kg^{-1} = 9.75×10^3 J

Total energy to melt = 4.31×10^3 J + 9.75×10^3 J = 1.41×10^4 J

Energy released on digestion = 345 $\times$ 4200 J = 1.45×10^6 J

15 % of energy released = 0.15 $\times$ 1.45 $\times 10^6$ J = 2.17×10^5 J

1.41×10^4 J is much less than 2.17×10^5 J (it is only about 1 % of the energy released), so the suggestion is not accurate.

Electric field strength

$$E = \frac{F}{Q}$$

$$E = \frac{Q}{4\pi\varepsilon_0 r^2}$$

$$E = \frac{V}{d}$$

Electric potential

$$V = \frac{Q}{4\pi\varepsilon_0 r}$$

Capacitance

$$C = \frac{Q}{V}$$

Energy stored in a capacitor

$$W = \tfrac{1}{2}QV$$

$$W = \tfrac{1}{2}CV^2$$

$$W = \tfrac{1}{2}\frac{Q^2}{C}$$

Capacitor discharge

$$Q = Q_0 e^{-t/RC}$$

$$I = I_0 e^{-t/RC}$$

$$V = V_0 e^{-t/RC}$$

$$\ln Q = \ln Q_0 - \frac{t}{RC}$$

$$\ln I = \ln I_0 - \frac{t}{RC}$$

$$\ln V = \ln V_0 - \frac{t}{RC}$$

In a magnetic field

$$F = BIl \sin\theta$$

$$F = Bqv \sin\theta$$

Faraday's and Lenz's laws

$$\mathscr{E} = \frac{-\mathrm{d}(N\phi)}{\mathrm{d}t}$$

Root-mean-square values

$$V_{rms} = \frac{V_0}{\sqrt{2}}$$

$$I_{rms} = \frac{I_0}{\sqrt{2}}$$

Nuclear and particle physics

In a magnetic field

$$r = \frac{p}{BQ}$$

Thermodynamics

Heating

$$\Delta E = mc\Delta\theta$$

$$\Delta E = L\Delta m$$

Molecular kinetic theory

$$\frac{1}{2}m\langle c^2\rangle = \frac{3}{2}kT$$

$$pV = \frac{1}{3}Nm\langle c^2\rangle$$

Ideal gas equation

$$pV = NkT$$

Stefan-Boltzmann law

$$L = \sigma AT^4$$

$$L = 4\pi r^2\sigma T^4$$

Wien's law

$$\lambda_{max}T = 2.898 \times 10^{-3}\ \text{m K}$$

Space

Intensity

$$I = \frac{L}{4\pi d^2}$$

Redshift of electromagnetic radiation

$$z = \frac{\Delta\lambda}{\lambda} \approx \frac{\Delta f}{f} \approx \frac{v}{c}$$

Cosmological expansion

$$v = H_0 d$$

Nuclear radiation

Mass-energy

$$\Delta E = c^2\Delta m$$

Radioactive decay

$$A = \lambda N$$

$$\frac{dN}{dt} = -\lambda N$$

$$\lambda = \frac{\ln 2}{t_{1/2}}$$

$$N = N_0\, e^{-\lambda t}$$

$$A = A_0\, e^{-\lambda t}$$

Gravitational fields

Gravitational force

$$F = \frac{Gm_1m_2}{r^2}$$

Gravitational field strength

$$g = \frac{Gm}{r^2}$$

Gravitational potential

$$V_{grav} = \frac{-Gm}{r}$$

Oscillations

Simple harmonic motion

$$F = -kx$$

$$a = -\omega^2 x$$

$$x = A\cos\omega t$$

$$v = -A\omega\sin\omega t$$

$$a = -A\omega^2\cos\omega t$$

$$T = \frac{1}{f} = \frac{2\pi}{\omega}$$

$$\omega = 2\pi f$$

Simple harmonic oscillator

$$T = 2\pi\sqrt{\frac{m}{k}}$$

$$T = 2\pi\sqrt{\frac{l}{g}}$$
