These questions belong to OCR, not to us.

The examination questions, mark schemes and examiner comments in this pack were written and published by OCR. They are past assessment materials, reproduced here so that students can revise from them.

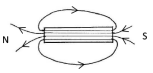

What we do not own

STEMUP is not affiliated with OCR and does not own, and makes no claim to own, any of the question, mark scheme or examiner report material in this pack. OCR has not endorsed, approved or been involved in the production of it. OCR and the qualification titles used here belong to their respective owners and appear for identification only.

Where to find the originals

OCR publishes its past papers, mark schemes and examiner reports. Always check the current specification at ocr.org.uk before you revise, because content and wording can change between series.

If you hold the rights to any material in this pack and would like it amended or removed, contact admin@stemup.co.uk and we will act on it.

Question			Answer/Indicative content	Marks	Guidance
1			B	1	
			Total	**1**	
2			B	1	
			Total	**1**	
3			A	1	
			Total	**1**	
4	a	i	Any 3 from: Place magnet on a sheet of (plain) paper (1) Place the compass near the end of the magnet (1) Mark the position that the compass needle points to (1) Move the compass so the opposite end is at this position and mark the new position where the compass tip settles (1) Repeat above and below the magnet and then connect the marks together to construct a fieldline (1)	3	**ALLOW** full marks for a fully annotated diagram that demonstrates how the experiment would be undertaken
		ii	Place a clear / transparent / paper cover over the magnet (1) (Sprinkle) on iron filings (to show the field pattern) (1)	2	**DO NOT ALLOW** marks for diagram
	b		Any one from: Compass shows direction of field lines (1) Iron filings are easily spilt (1) Iron filings are difficult to remove from magnets (1) Iron filings carries a greater risk / **AW** (1) (Idea of) less accurate field pattern (1) Drawing provides a permanent record (1)	1	
	c		Correct field pattern drawn, (1)  e.g. Correct direction of arrow heads (1)	2	Minimum of 4 field lines No field lines crossing
	d		As the distance from the wire increases the strength of the magnetic field falls / **AW** (1) (idea of) the non-linear nature of the relationship (1)	2

Question			Answer/Indicative content	Marks	Guidance
7		i	uniform field inside the (middle of) solenoid [1] correct outer shape [1]	2	**Ignore** arrows on field lines minimum of two 'straight and parallel' lines through solenoid minimum of one correctly drawn loop outside the solenoid **OR** a divergent field line outside the solenoid  **[2]** **Examiner's Comments** Drawing the magnetic field around a solenoid is something that has not been asked in this way previously. About a sixth of candidates omitted the question or failed to notice it was a question at all. The quality of the drawing was often unclear and marks were difficult to award for many answers due to this. Marks were available for a uniform field within the solenoid (two straight parallel lines) [1] and the correct outer shape (diverging field lines or a looped line outside the solenoid) [1]. The diagrams in the guidance in the mark scheme whilst not exhaustive, illustrates what was acceptable.
		ii	(same strength but) reverses direction / (same strength but) changes direction / AW [1]	1	**Allow** flips (direction) [1] **Examiner's Comments** This question asked what would happen if the current was reversed. Many wrote that this would increase the voltage rather than reverse it.

Question			Answer/Indicative content	Marks	Guidance
8	a	i	Any three from: place the compass onto the card or near to the wire (and turn on the current) ✓ plot / observe the direction of the compass / needle ✓ repeat idea of tip-to-tail / plotting onto the card ✓ repeat at different distances from the centre ✓	3 (AO3 × 1.2)	<u>Examiner's Comments</u> Q23 is an overlap question with J249/03. Identifying the command word 'describe' was key to candidates successfully answering this question. Those that did were able to apply their experience of practical activities supporting P4.1 and wrote down what they could do with a plotting compass in this experiment. Exemplar 14  (a) (i) Describe how the student could use this experiment and a compass to investigate the magnetic field produced by the wire. If you place a compass on top of the wire it should in the north direction ✗ [3] This candidate has not understood the question and is answering a different one about predicting how the compass will behave. Exemplar 15  (a) (i) Describe how the student could use this experiment and a compass to investigate the magnetic field produced by the wire. The student will turn on the battery to activate the circuit and with the cardboard use one hand to hold ✓ a compass on a point near the wire, and let it draw the magnetic field of the cardboard. [3] The candidate has not thought out what they were going to say, so they have only made one relevant point before running out of space. Exemplar 16  (a) (i) Describe how the student could use this experiment and a compass to investigate the magnetic field produced by the wire. Put the compass next to the wire ✓ and see where the arrow points ✓ if it points to the is no magnetic field. If it points out there is a magnetic field. [3]

Question			Answer/Indicative content	Marks	Guidance
					If the candidate had written their answer as bullet points it would have helped them to identify that after the first two clear descriptions they were no longer describing how to investigate a magnetic field. Exemplar 17  (a) (i) Describe how the student could use this experiment and a compass to investigate the magnetic field produced by the wire. place the plotting compass on the card and put a dot Draw a place the plotting compass on the card and put a dot when the compass needle is still with a x and repeat this it creates comes back around to the other side [3] This candidate's response is a good example of the effective use of short clear instructions when describing experimental procedures . It is much easier to follow this type of scientific writing rather than continuous descriptive prose in longer sentences.  **AfL** Give the students the instructions for a practical activity as a single descriptive paragraph and ask them to summarise the instructions a fixed number of short bullet points. Alternatively ask them to write down the procedure after they have completed the activity, but keeping to a word limit.
		ii	one or more circles around wire ✓ clockwise arrow(s) ✓	2 (AO2 × 2.2)	**DO NOT ALLOW** a spiral BUT **ALLOW** if clockwise direction shown by an arrow on the spiral then ✓ Examiner's Comments Some good answers were drawn by candidates. However, the annotated field direction on the drawings were not always correct. The question explicitly asks for the shape of the field around **this** wire. A common misconception was to draw the field around a bar magnet.

Question			Answer/Indicative content	Marks	Guidance
	b		**always** points to North / South ✓✓ **OR** Points to (magnetic) North / South ✓ line up with the magnetic field lines of the Earth ✓ **OR** Compass needle shows (an angle of) dip ✓ Dip (angle) changes (from equator) ✓	2 (AO2 ×1.1)	**ALLOW** Points North/South wherever you are ✓✓ Examiner's Comments This was a challenging question for candidates. This question asks about a quite separate behaviour of a magnetic compass in the Earth's magnetic field. Wherever you might happen to be on the surface of the Earth a magnetic (dipping) compass will always point north (or south). There were very few candidates who referred to the angle of dip in the direction of the north (or south) magnetic pole. Or that at the magnetic poles a dipping compass dips vertically downward towards the core of the Earth.
			Total	**7**	
9			A ✓	1 (AO1.2)	Examiner's Comments About two thirds of candidates gave the correct answer A.
			Total	**1**

Question			Answer/Indicative content	Marks	Guidance
10	a	i	Any three from: place the compass onto the card or near to the wire (and turn on the current) ✓ plot / observe the direction of the compass / needle ✓ repeat idea of tip-to-tail / plotting onto the card ✓ repeat at different distances from the centre ✓	3 (AO3 × 1.2)	Examiner's Comments Some candidate did not attempt to describe the experiment here. Most got the idea of placing the compass on the card or near the wire. Rather fewer described the plotting or observing using the compass. Fewer still suggested the idea of repeating at different distances or places. About a quarter of candidates gained all 3 marks here and about a quarter did not gain credit.
		ii	one or more circles around wire ✓ clockwise arrow(s) ✓	2 (AO2 × 2.2)	**DO NOT ALLOW** a spiral **BUT ALLOW** if clockwise direction shown by an arrow on the spiral Examiner's Comments This was well answered with about half of the candidates drawing a circular field [1] with arrows showing a clockwise direction [1]. Some candidates drew a circular field [1] but either got the direction wrong or did not indicate a direction at all. Some labelled it with both clockwise and anticlockwise arrows so the direction mark could not be given.
	b		**always** points to North / South ✓✓ **OR** Points to (magnetic) North / South ✓ line up with the magnetic field lines of the Earth ✓ **OR** Compass needle shows (an angle of) dip ✓ Dip (angle) changes (from equator) ✓	2 (AO2 ×1.1)	**ALLOW** Points North / South wherever you are ✓✓ Examiner's Comments Most candidates gained 1 mark for the idea of pointing north. Better answers (about a third) stated that the compass always pointed north and gained both marks. There were very few answers referring to the angle of dip.

Question			Answer/Indicative content	Marks	Guidance
11			D ✓	1 (AO1.1)	Examiner's Comments The majority of the candidates scored this mark. Some candidates chose response B. It is important that candidates read all the responses in these types of multiple-choice questions. A good technique is to eliminate responses first perhaps by placing a small cross next to (in this case A). Since both the size of the current and the distance from the wire are correct, then response D is selected.

STEMUP.CO.UK

Question			Answer/Indicative content	Marks	Guidance
12	a		One straight line between the middle of the two poles ✓	3 (AO1.2)	Ignore any field lines not between the labelled poles Allow dotted lines. Straight line by eye (rulers not used)
			At least 2 correctly curved lines between the edges of the poles, one above and one below ✓	(AO1.2)	Concave smooth curves
			Arrows on field lines going N to S ✓	(AO1.2)	Any wrong arrow loses this mark
					<u>Examiner's Comments</u> The question required candidates to sketch of the magnetic field 'between the North and South poles' and this was emphasised in the diagram by only labelling a single N and S. The three marks were given for: symmetrical(ish) convex cured lines joining the top and bottom of the adjacent poles, a straight line from the centre of the N to the centre of the S, and arrows on the lines going from N to S. Misconception A common misconception is for candidates to see one familiar thing in the stem of a question and assume that is what they are being asked to do. A number of candidates drew the 'standard' magnetic field around a bar magnet. Exemplar 4 is a response where the candidate has not understood the question. However, because they drew the field directions correctly they gained a consolation mark.

STEMUP.CO.UK

Question			Answer/Indicative content	Marks	Guidance
					Exemplar 4 
	b		Any one from: Induced magnets lose their magnetism (when away from a magnetic field)/AW ORA ✓ Permanent magnets retain their magnetism (when away from a magnetic field)/AW ✓	1 (AO1.1)	Examiner's Comments Around half the candidates correctly identified that induced magnetism was temporary. A common misconception was to explain induced magnetism in terms of electromagnets.
	c		Mistakes: When a voltage flows through them a magnetic field is created. ✓ The magnetic field can be increased by decreasing the number of turns..... ✓	2 (AO3.1b) (AO3.1b)	 Must circle 'voltage, or 'flows through', or whole sentence Should circle 'decreasing (the number of turns)' but NOT the increasing current bit. If a candidate circles 'magnetic field can be increased' and then circles all or part of the increasing current bit, award 1 mark only for this sentence. Examiner's Comments Most candidates identified one error (for example voltage or decreasing), and some two. A number tried to ring entire sentences without identifying the individual errors in the sentences. This approach was an allowed approach for the second sentence (where the two errors are unambiguous), but not for the third sentence where if one statement is correct the other will be incorrect. The magnetic field will only increase if the number of turns increases, or if the number of turns is decreased then the magnetic field will decrease.
