INTERNATIONAL A-LEVEL PHYSICS

Unit 3 Fields and their consequences

Wednesday 15 January 2025

07:00 GMT

Time allowed: 2 hours

Materials

For this paper you must have:

- a Data and Formulae Booklet as a loose insert
- a ruler with millimetre measurements
- a scientific calculator, which you are expected to use where appropriate
- a protractor.

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each question or on blank pages.
- All working must be shown.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.

Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 80.

Section AAnswer **all** questions in this section.**0 1**

Figure 1 shows a simple pendulum of length 67.7 m.
The pendulum bob is released from position **W** and swings in a vertical plane.

Figure 1

not to scale

The pendulum swings through an angle of 4.18° . The bob just reaches position **X**.
The horizontal distance between **W** and **X** is d .

Air resistance is negligible.

0 1 . 1Calculate d .**[2 marks]**

$$\text{half-angle} = 4.18^\circ / 2 = 2.09^\circ$$

$$d = 2 \times 67.7 \times \sin 2.09^\circ$$

$$d = 4.94 \text{ m}$$

$$d = \underline{\quad 4.9 \quad} \text{ m}$$

0 1 . 2 Calculate the maximum speed of the bob.

[3 marks]

$$T = 2\pi\sqrt{l/g} = 2\pi\sqrt{67.7/9.81} = 16.5 \text{ s}$$

$$\omega = 2\pi/T = 2\pi/16.5 = 0.381 \text{ rad s}^{-1}$$

$$\text{amplitude } A = d/2 = 4.94/2 = 2.47 \text{ m}$$

$$v_{\max} = \omega A = 0.381 \times 2.47$$

$$v_{\max} = 0.94 \text{ m s}^{-1}$$

maximum speed = 0.94 m s⁻¹

Question 1 continues on the next page

Turn over ►

The pendulum is at point **P** on the surface of the Earth.

0 1 . 3 Figure 2 shows **P**.

The line joining **P** to the centre of the Earth is at an angle of 41° to the Earth's axis.
Due to the Earth's rotation, **P** travels in a circular path about the Earth's axis.

Figure 2

Calculate the linear speed of **P** due to the rotation of the Earth.

[2 marks]

$$\text{radius of circular path } r = R_E \sin 41^\circ = 6.37 \times 10^6 \times \sin 41^\circ = 4.18 \times 10^6 \text{ m}$$

$$\text{circumference} = 2\pi r = 2\pi \times 4.18 \times 10^6 = 2.63 \times 10^7 \text{ m}$$

$$\text{time for one rotation} = 24 \times 3600 = 86\,400 \text{ s}$$

$$v = 2.63 \times 10^7 / 86\,400 = 304 \text{ m s}^{-1}$$

speed = 304 m s⁻¹

0 1 . 4

Due to the rotation of the Earth, the plane of oscillation of the pendulum rotates slowly about a vertical axis relative to the floor.

The plane of oscillation rotates through 360° in 31.8 hours.

Pegs are placed on the floor at positions **X** and **Y** on a circle.

The angle between **X** and **Y**, measured at the centre of the circle, is 22.5° as shown in **Figure 3**.

Figure 3 shows the pendulum just after it knocks over the peg at **X**.

The plane of oscillation continues to rotate relative to the floor. The amplitude of oscillation of the pendulum is unchanged.

After knocking over the peg at **X**, the pendulum goes through n oscillations before knocking over the peg at **Y**.

Calculate n .

[3 marks]

$$\text{period } T = 16.5 \text{ s}$$

$$\text{time to rotate } 22.5^\circ = (22.5 / 360) \times 31.8 \times 3600 = 7155 \text{ s}$$

$$n = 7155 / 16.5 = 433$$

$$n = \underline{\quad 433 \quad}$$

10

Turn over ►

0 2

An unpowered spacecraft **B** orbits the Sun.
The orbit is not circular.
Assume that the only gravitational force on **B** is due to the Sun.

The following data are about **B**:

mass of **B** = 1600 kg

smallest distance between **B** and the centre of the Sun = 4.20×10^{10} m

largest distance between **B** and the centre of the Sun = 1.37×10^{11} m.

0 2 . 1

Calculate the maximum gravitational force of the Sun on **B**.

[2 marks]

max force at smallest distance: $F = GMm / r^2$

$$F = 6.67 \times 10^{-11} \times 1.99 \times 10^{30} \times 1600 / (4.20 \times 10^{10})^2$$

$$F = 120 \text{ N}$$

maximum gravitational force = 120 N

0 2 . 2

The total orbital energy of a satellite is the sum of its kinetic energy and its gravitational potential energy.
The total energy of **B** is -1.19×10^{12} J.

Calculate the minimum speed of **B**.

[3 marks]

minimum speed at the largest distance, $r = 1.37 \times 10^{11}$ m

$$E_p = -GMm / r = -6.67 \times 10^{-11} \times 1.99 \times 10^{30} \times 1600 / 1.37 \times 10^{11}$$

$$E_p = -1.55 \times 10^{12} \text{ J}$$

$$E_k = E_{\text{total}} - E_p = -1.19 \times 10^{12} - (-1.55 \times 10^{12}) = 3.60 \times 10^{11} \text{ J}$$

$$\frac{1}{2}mv^2 = E_k: v = \sqrt{2 \times 3.60 \times 10^{11} / 1600}$$

$$v = 2.1 \times 10^4 \text{ m s}^{-1}$$

minimum speed = 2.1×10^4 m s⁻¹

An unpowered spacecraft **C** is in a circular orbit of the Sun.
C has an orbital period of 1.45×10^7 s.

0 2 . 3 Calculate the orbital radius of **C**.

[3 marks]

gravitational force = mass $\times$ centripetal acceleration

$$GMm / r^2 = m\omega^2 r, \quad \omega = 2\pi / T$$

$$r^3 = GMT^2 / 4\pi^2 = 6.67 \times 10^{-11} \times 1.99 \times 10^{30} \times (1.45 \times 10^7)^2 / 4\pi^2$$

$$r^3 = 7.07 \times 10^{32} \text{ m}^3$$

$$r = 8.9 \times 10^{10} \text{ m}$$

orbital radius = 8.9×10^{10} m

0 2 . 4 Explain which spacecraft, **B** or **C**, is moving on an equipotential.

[1 mark]

C: the gravitational potential is constant on an equipotential. C stays at a constant radius from the Sun, so it is on an equipotential, while the radius of B changes.

9

Turn over for the next question

Turn over ►

0 3

Figure 4 shows an arrangement that is used to investigate the properties of electrons.

Figure 4

Electrons are emitted from a wire filament with a negligible initial speed.
The electrons are accelerated through a potential difference V_1 towards an electrode.
The electrons that pass through the hole at **A** have a speed of $1.48 \times 10^7 \text{ m s}^{-1}$.

0 3 . 1

Calculate V_1 .

[2 marks]

$$eV_1 = \frac{1}{2}mv^2$$

$$V_1 = mv^2 / 2e = 9.11 \times 10^{-31} \times (1.48 \times 10^7)^2 / (2 \times 1.60 \times 10^{-19})$$

$$V_1 = 624 \text{ V}$$

$$V_1 = \underline{\quad 624 \quad} \text{ V}$$

Figure 4 shows the electron beam entering a uniform electric field between two horizontal plates.

At **B**, the electrons are moving horizontally.

The uniform electric field causes the electrons to accelerate.

0 3 . 2

Describe this acceleration.
Explain your answer.

[3 marks]

The acceleration is constant and vertically downwards.

The electric field between the plates is uniform, so the force on each electron ($F = eE$) is constant, giving a constant acceleration.

The field points upwards, from the positive lower plate to the upper plate. The electrons are negative, so the force on them is opposite to the field: downwards.

Question 3 continues on the next page

Turn over ►

The curved line on **Figure 5** shows the path of electrons on the fluorescent screen between the horizontal plates.

Figure 5

to scale

Each square on the screen measures 10 mm by 10 mm.

0 3 . 3

The horizontal component of an electron's velocity is $1.48 \times 10^7 \text{ m s}^{-1}$.

Show that the time taken for the electron to cross the screen is about 8 ns.

[1 mark]

$$\text{width of screen} = 12 \text{ squares} \times 10 \text{ mm} = 0.120 \text{ m}$$

$$t = 0.120 / 1.48 \times 10^7 = 8.1 \times 10^{-9} \text{ s} \approx 8 \text{ ns}$$

0 3 . 4

The potential difference across the plates is equal to V_2 .

Determine V_2 .

[4 marks]

$$\text{vertical displacement across screen} = 27 \text{ mm} = 0.027 \text{ m}$$

$$s = \frac{1}{2}at^2: a = 2s / t^2 = 2 \times 0.027 / (8.1 \times 10^{-9})^2 = 8.23 \times 10^{14} \text{ m s}^{-2}$$

$$F = ma = 9.11 \times 10^{-31} \times 8.23 \times 10^{14} = 7.50 \times 10^{-16} \text{ N}$$

$$F = V_2 e / d \text{ with plate separation } d = 0.070 \text{ m}$$

$$V_2 = Fd / e = 7.50 \times 10^{-16} \times 0.070 / 1.60 \times 10^{-19}$$

$$V_2 = 328 \text{ V}$$

$$V_2 = \underline{\hspace{2cm} 328 \hspace{2cm}} \text{ V}$$

0 3 . 5

The apparatus is enclosed in a glass tube.
Initially there is no air in the glass tube.
A fault occurs and some air leaks into the tube.

Explain **two** effects on the curved line seen on the screen.

[2 marks]

1 The line becomes broader (more spread out), as collisions with air particles scatter the electrons and give them a range of speeds.

2 The line becomes fainter, as some electrons are stopped by collisions and do not reach the screen.

ANSWER IN THE SPACES PROVIDED**

0 4

Figure 6 shows an arrangement for collecting data from a circuit that is used to charge a capacitor.

A data logger is connected to a current sensor and to a voltage sensor. The data are analysed.

Figure 6

The battery has an emf ε and negligible internal resistance. The resistance of the resistor is R and the capacitance of the capacitor is C .

The capacitor is initially uncharged.

The switch is then closed and the voltage V_c across the capacitor and the current I are recorded. Further readings of V_c and I are recorded at regular time intervals.

It can be shown that:

$$V_c = \varepsilon - IR$$

Question 4 continues on the next page

Turn over ►

Figure 7 shows the plot of V_c against I .

Figure 7

0 4 . 1 Determine ε .

[1 mark]

$\varepsilon =$ 6.2 V

0 4 . 2 Determine R .

[2 marks]

$$R = -\text{gradient} = \varepsilon / I\text{-intercept} = 6.2 / 0.95 \times 10^{-3}$$

$$R = 6.5 \times 10^3 \Omega$$

$R =$ 6.5×10^3 Ω

The data shown on **Figure 7** were recorded at time intervals of 5.0 ms.

0 4 . 3

Explain why the plotted points on **Figure 7** become closer together as V_c increases.

[1 mark]

As V_c increases the current is smaller, so less charge flows onto the capacitor per second and V_c increases by less in each 5.0 ms interval.

0 4 . 4

Determine the time constant for the circuit in **Figure 6** on page 13.
Go on to calculate C .

[5 marks]

from Figure 7: at $t = 0$, $I_0 = 0.95 \text{ mA}$ ($V_c = 0$)

two intervals later, $t = 2 \times 5.0 \text{ ms} = 10 \text{ ms}$: $I = 0.47 \text{ mA}$

$$I = I_0 e^{-t/RC}; \quad 0.47 = 0.95 e^{-0.010/RC}$$

$$\ln(0.95 / 0.47) = 0.010 / RC$$

$$RC = 0.010 / 0.704$$

$$\text{time constant } RC = 1.4 \times 10^{-2} \text{ s}$$

$$C = RC / R = 1.42 \times 10^{-2} / 6.5 \times 10^3$$

$$C = 2.2 \times 10^{-6} \text{ F}$$

$$\text{time constant} = \underline{1.4 \times 10^{-2}} \text{ s}$$

$$C = \underline{2.2 \times 10^{-6}} \text{ F}$$

Question 4 continues on the next page

Turn over ►

0 4 . 5

When the capacitor is fully charged the switch is opened. The battery is then removed from the circuit.

Figure 8 shows the new circuit for the charged capacitor.

Figure 8

The switch is then closed and the capacitor discharges through the resistor.

Draw, on **Figure 9**, a line showing the variation of the magnitude of V_c with the magnitude of I for this experiment.

[2 marks]

Figure 9

0 4 . 6

Suggest why a data logger and sensors were used in these experiments rather than an ammeter, a voltmeter and a stopwatch.

[1 mark]

The readings change too quickly: the time interval (5 ms) is too short to record the meter readings manually.

12

Turn over ►

0 5Cobalt-60 (^{60}Co) is a radioactive isotope used in some school laboratories.A school has a sealed ^{60}Co source with an activity of 62 kBq.

$$\begin{aligned}\text{half-life of } ^{60}\text{Co} &= 1.66 \times 10^8 \text{ s} \\ \text{molar mass of } ^{60}\text{Co} &= 60.0 \text{ g mol}^{-1}\end{aligned}$$

0 5 . 1Calculate, in g, the mass of ^{60}Co in the sealed source.**[3 marks]**

$$\lambda = \ln 2 / T_{1/2} = 0.693 / 1.66 \times 10^8 = 4.18 \times 10^{-9} \text{ s}^{-1}$$

$$A = \lambda N: N = 62 \times 10^3 / 4.18 \times 10^{-9} = 1.48 \times 10^{13}$$

$$\text{mass} = N \times \text{molar mass} / N_A = 1.48 \times 10^{13} \times 60.0 / 6.02 \times 10^{23}$$

$$\text{mass} = 1.48 \times 10^{-9} \text{ g}$$

$$\text{mass} = \underline{1.48 \times 10^{-9}} \text{ g}$$

0 5 . 2The school plans to replace the source when the activity of the ^{60}Co has decreased to 9.0 kBq.

Calculate, in years, the time before the source needs to be replaced.

[3 marks]

$$A = A_0 e^{-\lambda t}: 9.0 = 62 e^{-\lambda t}$$

$$\lambda t = \ln(62 / 9.0) = 1.93$$

$$t = 1.93 / 4.18 \times 10^{-9} = 4.62 \times 10^8 \text{ s}$$

$$t = 4.62 \times 10^8 / (365 \times 24 \times 3600) = 14.6 \text{ years}$$

$$\text{time} = \underline{15} \text{ years}$$

6

0 6 . 1

Define the tesla.

[1 mark]

The tesla is the magnetic flux density that produces a force of 1 N on each metre of a wire carrying a current of 1 A at right angles to the magnetic field.

For all parts of **Question 6**, assume that the Earth's magnetic flux density is negligible.

0 6 . 2

Figure 10 shows a dc power supply connected to two horizontal metal rails. A copper rod rests on the rails, completing the circuit. Initially the power supply is off.

Figure 10

A uniform magnetic field is applied vertically downwards between the two rails. When the power supply is switched on, the copper rod rolls to the left.

Label with a + sign the positive terminal of the power supply in **Figure 10**. Explain your answer.

[2 marks]

By Fleming's left-hand rule (field down, force to the left) the current in the rod is into the page, from the front rail to the back rail, so it leaves the supply via the front rail; the right-hand terminal is positive.

Question 6 continues on the next page

Turn over ►

0 6 . 3

The power supply is switched off.

The rails are tilted at an angle of 10.0° to the horizontal.

The direction of the magnetic field is changed so that it remains at 90° to the rails.

The power supply is switched on and the rod is placed on the rails. The combination of magnetic and gravitational forces acting on the rod keep it stationary.

Figure 11 shows a side view of the arrangement.

Figure 11

side view

The current in the rod is 2.75 A and the magnetic flux density is 0.11 T.

The distance between the rails is 82 mm.

Calculate the mass of the rod.

[3 marks]

$$\text{magnetic force } F = BIl = 0.11 \times 2.75 \times 0.082 = 0.0248 \text{ N}$$

$$\text{component of weight down the slope} = mg \sin 10.0^\circ$$

$$mg \sin 10.0^\circ = BIl$$

$$m = 0.0248 / (9.81 \times \sin 10.0^\circ)$$

$$m = 0.015 \text{ kg}$$

mass = 0.015 kg

0 6 . 4

The connections to the power supply are removed.

The rails remain tilted at an angle of 10.0° to the horizontal and the magnetic field is unchanged.

The rod is placed on the rails and released.

The rod accelerates down the rails.

State and explain what happens to the emf induced across the rod.

[2 marks]

The induced emf increases.

As the rod accelerates it cuts the magnetic flux at a greater rate, so the rate of change of flux linkage increases.

By Faraday's law the induced emf is directly proportional to the rate of change of flux linkage, so the emf increases as the rod speeds up.

0 7

Figure 12 shows the oscilloscope trace of the output of an ac power supply.

Figure 12

The root mean square (rms) voltage is 12.0 V and the frequency is 60.0 Hz.

0 7 . 1

Determine:

- the y-gain setting in V cm^{-1}
- the time-base setting in ms cm^{-1} .

[4 marks]

$$\text{peak voltage} = 12.0 \times \sqrt{2} = 16.97 \text{ V}; \text{ peak height on trace} = 3.4 \text{ cm}$$

$$y\text{-gain} = 16.97 / 3.4 = 5.0 \text{ V cm}^{-1}$$

$$\text{period } T = 1 / 60.0 = 16.7 \text{ ms}; \text{ one cycle} = 6.67 \text{ cm on trace}$$

$$\text{time-base} = 16.7 / 6.67 = 2.5 \text{ ms cm}^{-1}$$

$$y\text{-gain} = \underline{\quad 5.0 \quad} \text{ V cm}^{-1}$$

$$\text{time-base} = \underline{\quad 2.5 \quad} \text{ ms cm}^{-1}$$

0 7 . 2

The output of the power supply is connected to the primary coil of a transformer.
The rms voltage output of the transformer is 3.0 V.
The number of turns on the secondary coil of the transformer is 4500

Calculate the number of turns on the primary coil.

[1 mark]

$$N_p / N_s = V_p / V_s: N_p = 4500 \times 12.0 / 3.0$$

number of turns = 18 000

0 7 . 3

A resistor **R** is connected across the secondary coil.
The rms voltage across **R** is measured.

State the other measurements needed to determine the efficiency of the transformer.

[1 mark]

The rms current in the primary coil and the rms current in the
secondary coil (or the resistance of R).

0 7 . 4

State **two** causes of inefficiency in a transformer.

[2 marks]

1 Eddy currents induced in the iron core heat the core.

2 Heating of the wires of the coils due to their resistance.

A proton passes through two evacuated chambers.

The chambers contain uniform magnetic fields of magnetic flux density B_1 and B_2 .

The path of the proton is at right angles to the magnetic field in each chamber.

The diagram shows the path of the proton from above.

$$x = \frac{\text{speed in second chamber}}{\text{speed in first chamber}}$$

Which row describes x and the directions of B_1 and B_2 ?

[1 mark]

	x	Direction of B_1	Direction of B_2	
A	>1	out of the page	into the page	☐
B	1	into the page	out of the page	☒
C	1	out of the page	into the page	☐
D	>1	into the page	out of the page	☐

The following information is for Questions **21** and **22**.

A square coil of side 0.12 m has 20 turns.

The coil rotates with a frequency of 75 Hz in a uniform magnetic field.

The magnetic flux density is 45 mT.

The axis of rotation of the coil **XY** is at right angles to the magnetic field.

2 1 What is the maximum emf induced in the coil?

[1 mark]

- A** 0.30 V ☐
- B** 1.0 V ☐
- C** 6.1 V ☒
- D** 51 V ☐

2 2 What is the flux linkage at the instant when the minimum emf is induced in the coil?

[1 mark]

- A** 0 ☐
- B** 0.65 mWb ☐
- C** 13 mWb ☒
- D** 110 mWb ☐
